balance	<i>Functions to compute the balance statistics</i>
---------	--

Description

This function computes the balance statistics before and after matching.

Usage

```
balance(rawdata, treat, matched, estimand="ATT")

## S3 method for class 'balance'
print(x, ..., combined = FALSE, digits = 2)

## S3 method for class 'balance'
plot(x, longcovnames=NULL, which.covs="mixed",
      v.axis=TRUE, cex.main=1, cex.vars=1, cex.pts=1,
      mar=c(4, 3, 5.1, 2), plot=TRUE, x.max = NULL, ...)
```

Arguments

rawdata	The full covariate dataset
treat	the vector of treatment assignments for the full dataset
matched	vector of weights to apply to the full dataset to create the restructured data: for matching without replacement these will all be 0's and 1's; for one-to-one matching with replacement these will all be non-negative integers; for IPTW or more complicated matching methods these could be any non-negative numbers
estimand	can either be ATT, ATC, or ATE, default is ATT
x	an object return by the balance function.
combined	default is FALSE
digits	minimal number of <i>significant</i> digits, default is 2.
longcovnames	long covariate names. If not provided, plot will use covariate variable name by default
which.covs	mixed then it plots all as std diffs; binary it only plots binary and as abs unstd diffs; cont it only plots non-binary and as abs std diffs
v.axis	default is TRUE, which shows the top axis-axis(3).
cex.main	font size of main title
cex.vars	font size of variabel names
cex.pts	point size of the estimates
mar	A numerical vector of the form <code>c(bottom, left, top, right)</code> which gives the number of lines of margin to be specified on the four sides of the plot. The default is <code>c(0, 3, 5.1, 2)</code> .
plot	default is TRUE, which will plot the plot.
x.max	set the max of the xlim, default is NULL
...	other plot options may be passed to this function

Details

This function plots the balance statistics before and after matching. The open circle dots represent the unmatched balance statistics. The solid dots represent the matched balance statistics. The closer the value of the estimates to the zero, the better the treated and control groups are balanced after matching.

Note

The function does not work with predictors that contain `factor(x)`, `log(x)` or all other data transformation. Create new objects for these variables. Attach them into the original dataset before doing the matching procedure.

```

bayesglm

Bayesian generalized linear models.

Description

Bayesian functions for generalized linear modeling with independent normal, t, or Cauchy prior distribution for the coefficients.

Usage

```
bayesglm (formula, family = gaussian, data,
          weights, subset, na.action,
          start = NULL, etastart, mustart,
          offset, control = list(...),
          model = TRUE, method = "glm.fit",
          x = FALSE, y = TRUE, contrasts = NULL,
          drop.unused.levels = TRUE,
          prior.mean = 0,
          prior.scale = NULL,
          prior.df = 1,
          prior.mean.for.intercept = 0,
```

```

prior.scale.for.intercept = NULL,
prior.df.for.intercept = 1,
min.prior.scale=1e-12,
scaled = TRUE, keep.order=TRUE,
drop.baseline=TRUE,
maxit=100,
print.unnormalized.log.posterior=FALSE,
Warning=TRUE,...)

bayesglm.fit (x, y, weights = rep(1, nobs),
start = NULL, etastart = NULL,
mustart = NULL, offset = rep(0, nobs), family = gaussian(),
control = list(), intercept = TRUE,
prior.mean = 0,
prior.scale = NULL,
prior.df = 1,
prior.mean.for.intercept = 0,
prior.scale.for.intercept = NULL,
prior.df.for.intercept = 1,
min.prior.scale=1e-12, scaled = TRUE,
print.unnormalized.log.posterior=FALSE, Warning=TRUE)

```

Arguments

formula	a symbolic description of the model to be fit. The details of model specification are given below.
family	a description of the error distribution and link function to be used in the model. This can be a character string naming a family function, a family function or the result of a call to a family function. (See family for details of family functions.)
data	an optional data frame, list or environment (or object coercible by as.data.frame to a data frame) containing the variables in the model. If not found in data, the variables are taken from <code>environment(formula)</code> , typically the environment from which <code>glm</code> is called.
weights	an optional vector of weights to be used in the fitting process. Should be <code>NULL</code> or a numeric vector.
subset	an optional vector specifying a subset of observations to be used in the fitting process.
na.action	a function which indicates what should happen when the data contain NAs. The default is set by the <code>na.action</code> setting of options , and is <code>na.fail</code> if that is unset. The “factory-fresh” default is <code>na.omit</code> . Another possible value is <code>NULL</code> , no action. Value <code>na.exclude</code> can be useful.
start	starting values for the parameters in the linear predictor.
etastart	starting values for the linear predictor.
mustart	starting values for the vector of means.
offset	this can be used to specify an <i>a priori</i> known component to be included in the linear predictor during fitting. This should be <code>NULL</code> or a numeric vector of length

	either one or equal to the number of cases. One or more <code>offset</code> terms can be included in the formula instead or as well, and if both are specified their sum is used. See <code>model.offset</code> .
<code>control</code>	a list of parameters for controlling the fitting process. See the documentation for <code>glm.control</code> for details.
<code>model</code>	a logical value indicating whether <code>model.frame</code> should be included as a component of the returned value.
<code>method</code>	the method to be used in fitting the model. The default method <code>"glm.fit"</code> uses iteratively reweighted least squares (IWLS). The only current alternative is <code>"model.frame"</code> which returns the model frame and does no fitting.
<code>x, y</code>	For <code>glm</code> : logical values indicating whether the response vector and model matrix used in the fitting process should be returned as components of the returned value. For <code>glm.fit</code> : <code>x</code> is a design matrix of dimension $n * p$, and <code>y</code> is a vector of observations of length n .
<code>contrasts</code>	an optional list. See the <code>contrasts.arg</code> of <code>model.matrix.default</code> .
<code>drop.unused.levels</code>	default TRUE, if FALSE, it interpolates the intermediate values if the data have integer levels.
<code>intercept</code>	logical. Should an intercept be included in the <i>null</i> model?
<code>prior.mean</code>	prior mean for the coefficients: default is 0. Can be a vector of length equal to the number of predictors (not counting the intercept, if any). If it is a scalar, it is expanded to the length of this vector.
<code>prior.scale</code>	prior scale for the coefficients: default is NULL; if is NULL, for a logit model, <code>prior.scale</code> is 2.5; for a probit model, prior scale is $2.5 * 1.6$. Can be a vector of length equal to the number of predictors (not counting the intercept, if any). If it is a scalar, it is expanded to the length of this vector.
<code>prior.df</code>	prior degrees of freedom for the coefficients. For t distribution: default is 1 (Cauchy). Set to Inf to get normal prior distributions. Can be a vector of length equal to the number of predictors (not counting the intercept, if any). If it is a scalar, it is expanded to the length of this vector.
<code>prior.mean.for.intercept</code>	prior mean for the intercept: default is 0. See 'Details'.
<code>prior.scale.for.intercept</code>	prior scale for the intercept: default is NULL; for a logit model, prior scale for intercept is 10; for probit model, prior scale for intercept is rescaled as $10 * 1.6$.
<code>prior.df.for.intercept</code>	prior degrees of freedom for the intercept: default is 1.
<code>min.prior.scale</code>	Minimum prior scale for the coefficients: default is $1e-12$.
<code>scaled</code>	<code>scaled=TRUE</code> , the scales for the prior distributions of the coefficients are determined as follows: For a predictor with only one value, we just use <code>prior.scale</code> . For a predictor with two values, we use <code>prior.scale/range(x)</code> . For a predictor with more than two values, we use <code>prior.scale/(2*sd(x))</code> . If the response is Gaussian, <code>prior.scale</code> is also multiplied by $2 * sd(y)$. Default is TRUE

<code>keep.order</code>	a logical value indicating whether the terms should keep their positions. If FALSE the terms are reordered so that main effects come first, followed by the interactions, all second-order, all third-order and so on. Effects of a given order are kept in the order specified. Default is TRUE.
<code>drop.baseline</code>	Drop the base level of categorical x's, default is TRUE.
<code>maxit</code>	integer giving the maximal number of IWLS iterations, default is 100. This can also be controlled by <code>control</code> .
<code>print.unnormalized.log.posterior</code>	display the unnormalized log posterior likelihood for bayesglm, default=FALSE
Warning	default is TRUE, which will show the error messages of not convergence and separation.
...	further arguments passed to or from other methods.

Details

The program is a simple alteration of `glm()` that uses an approximate EM algorithm to update the betas at each step using an augmented regression to represent the prior information.

We use Student-t prior distributions for the coefficients. The prior distribution for the constant term is set so it applies to the value when all predictors are set to their mean values.

If `scaled=TRUE`, the scales for the prior distributions of the coefficients are determined as follows: For a predictor with only one value, we just use `prior.scale`. For a predictor with two values, we use `prior.scale/range(x)`. For a predictor with more than two values, we use `prior.scale/(2*sd(x))`.

We include all the `glm()` arguments but we haven't tested that all the options (e.g., `offsets`, `contrasts`, `deviance` for the null model) all work.

The new arguments here are: `prior.mean`, `prior.scale`, `prior.scale.for.intercept`, `prior.df`, `prior.df.for.intercept` and `scaled`.

Value

See [glm](#) for details.

<code>prior.mean</code>	prior means for the coefficients and the intercept.
<code>prior.scale</code>	prior scales for the coefficients
<code>prior.df</code>	prior dfs for the coefficients.
<code>prior.scale.for.intercept</code>	prior scale for the intercept
<code>prior.df.for.intercept</code>	prior df for the intercept

 bayespolr

Bayesian Ordered Logistic or Probit Regression

Description

Bayesian functions for ordered logistic or probit modeling with independent normal, t, or Cauchy prior distribution for the coefficients.

Usage

```
bayespolr(formula, data, weights, start, ...,
  subset, na.action, contrasts = NULL,
  Hess = TRUE, model = TRUE,
  method = c("logistic", "probit", "cloglog", "cauchit"),
  drop.unused.levels=TRUE,
  prior.mean = 0,
  prior.scale = 2.5,
  prior.df = 1,
  prior.counts.for.bins = NULL,
  min.prior.scale=1e-12,
  scaled = TRUE,
  maxit = 100,
  print.unnormalized.log.posterior = FALSE)
```

Arguments

formula	a formula expression as for regression models, of the form response ~ predictors. The response should be a factor (preferably an ordered factor), which will be interpreted as an ordinal response, with levels ordered as in the factor. A proportional odds model will be fitted. The model must have an intercept: attempts to remove one will lead to a warning and be ignored. An offset may be used. See the documentation of formula for other details.
data	an optional data frame in which to interpret the variables occurring in formula.
weights	optional case weights in fitting. Default to 1.
start	initial values for the parameters. This is in the format c(coefficients, zeta)
...	additional arguments to be passed to optim, most often a control argument.
subset	expression saying which subset of the rows of the data should be used in the fit. All observations are included by default.
na.action	a function to filter missing data.

<code>contrasts</code>	a list of contrasts to be used for some or all of the factors appearing as variables in the model formula.
<code>Hess</code>	logical for whether the Hessian (the observed information matrix) should be returned.
<code>model</code>	logical for whether the model matrix should be returned.
<code>method</code>	logistic or probit or complementary log-log or <code>cauchit</code> (corresponding to a Cauchy latent variable and only available in R $\geq 2.1.0$).
<code>drop.unused.levels</code>	default TRUE, if FALSE, it interpolates the intermediate values if the data have integer levels.
<code>prior.mean</code>	prior mean for the coefficients: default is 0. Can be a vector of length equal to the number of predictors (not counting the intercepts). If it is a scalar, it is expanded to the length of this vector.
<code>prior.scale</code>	prior scale for the coefficients: default is 2.5. Can be a vector of length equal to the number of predictors (not counting the intercepts). If it is a scalar, it is expanded to the length of this vector.
<code>prior.df</code>	for t distribution: default is 1 (Cauchy). Set to <code>Inf</code> to get normal prior distributions. Can be a vector of length equal to the number of predictors (not counting the intercepts). If it is a scalar, it is expanded to the length of this vector.
<code>prior.counts.for.bins</code>	default is NULL, which will augment the data by giving each cut point a $1/\text{levels}(y)$. To use a noninformative prior, assign <code>prior.counts.for.bins = 0</code> . If it is a scalar, it is expanded to the number of levels of y.
<code>min.prior.scale</code>	Minimum prior scale for the coefficients: default is $1e-12$.
<code>scaled</code>	if <code>scaled = TRUE</code> , then the prior distribution is rescaled. Can be a vector of length equal to the number of cutpoints (intercepts). If it is a scalar, it is expanded to the length of this vector.
<code>maxit</code>	integer giving the maximal number of IWLS iterations, default is 100. This can also be controlled by <code>control</code> .
<code>print.unnormalized.log.posterior</code>	display the unnormalized log posterior likelihood for <code>bayesglm</code> fit, default=FALSE

Details

The program is a simple alteration of `polr` in VR version 7.2-31 that augments the loglikelihood with the log of the t prior distributions for the coefficients.

We use Student-t prior distributions for the coefficients. The prior distributions for the intercepts (the cutpoints) are set so they apply to the value when all predictors are set to their mean values.

If `scaled=TRUE`, the scales for the prior distributions of the coefficients are determined as follows: For a predictor with only one value, we just use `prior.scale`. For a predictor with two values, we use `prior.scale/range(x)`. For a predictor with more than two values, we use `prior.scale/(2*sd(x))`.

Value

See `polr` for details.

`prior.mean` prior means for the coefficients.
`prior.scale` prior scales for the coefficients.
`prior.df` prior dfs for the coefficients.
`prior.counts.for.bins`
 prior counts for the cutpoints.

binnedplot

Binned Residual Plot

Description

A function that plots averages of y versus averages of x and can be useful to plot residuals for logistic regression.

Usage

```
binnedplot(x ,y, nclass=NULL,
  xlab="Expected Values", ylab="Average residual",
  main="Binned residual plot",
  cex.pts=0.8, col.pts=1, col.int="gray", ...)
```

Arguments

x The expected values from the logistic regression.

y	The residuals values from logistic regression (observed values minus expected values).
nclass	Number of categories (bins) based on their fitted values in which the data are divided. Default=NULL and will take the value of nclass according to the n such that if $n \geq 100$, $nclass = \text{floor}(\sqrt{\text{length}(x)})$; if $10 < n < 100$, $nclass = 10$; if $n < 10$, $nclass = \text{floor}(n/2)$.
xlab	a label for the x axis, default is "Expected Values".
ylab	a label for the y axis, default is "Average residual".
main	a main title for the plot, default is "Binned residual plot". See also <code>title</code> .
cex.pts	The size of points, default=0.8.
col.pts	color of points, default is black
col.int	color of intervals, default is gray
...	Graphical parameters to be passed to methods

Details

In logistic regression, as with linear regression, the residuals can be defined as observed minus expected values. The data are discrete and so are the residuals. As a result, plots of raw residuals from logistic regression are generally not useful. The binned residuals plot instead, after dividing the data into categories (bins) based on their fitted values, plots the average residual versus the average fitted value for each bin.

Value

A plot in which the gray lines indicate plus and minus 2 standard-error bounds, within which one would expect about 95% of the binned residuals to fall, if the model were actually true.

Note

There is typically some arbitrariness in choosing the number of bins: each bin should contain enough points so that the averaged residuals are not too noisy, but it helps to have also many bins so as to see more local patterns in the residuals (see Gelman and Hill, *Data Analysis Using Regression and Multilevel/Hierarchical Models*, pag 97).

         main=NULL, xlab=NULL, ylab=NULL,
         plot=TRUE, add=FALSE, offset=.1,
         mar=c(1,3,5.1,2), ...)

## S4 method for signature 'numeric'
coefplot(object, ...)
## S4 method for signature 'lm'
coefplot(object, varnames=NULL, intercept=FALSE, ...)
## S4 method for signature 'glm'
```

```
coefplot(object, varnames=NULL, intercept=FALSE, ...)
## S4 method for signature 'polr'
coefplot(object, varnames=NULL, ...)
```

Arguments

object	fitted objects-lm, glm, bugs and polr, or a vector of coefficients.
...	further arguments passed to or from other methods.
coefs	a vector of coefficients.
sds	a vector of sds of coefficients.
CI	confidence interval, default is 2, which will plot plus and minus 2 sds or 95% CI. If CI=1, plot plus and minus 1 sds or 50% CI instead.
lower.conf.bounds	lower bounds of confidence intervals.
upper.conf.bounds	upper bounds of confidence intervals.
varnames	a vector of variable names, default is NULL, which will use the names of variables; if specified, the length of varnames must be equal to the length of predictors, including the intercept.
vertical	orientation of the plot, default is TRUE which will plot variable names in the 2nd axis. If FALSE, plot variable names in the first axis instead.
v.axis	default is TRUE, which shows the bottom axis-axis(1).
h.axis	default is TRUE, which shows the left axis-axis(2).
cex.var	The fontsize of the variable names, default=0.8.
cex.pts	The size of data points, default=0.9.
col.pts	color of points and segments, default is black.
pch.pts	symbol of points, default is solid dot.
var.las	the orientation of variable names against the axis, default is 2. see the usage of las in par .
main	The main title (on top) using font and size (character expansion) <code>par("font.main")</code> and color <code>par("col.main")</code> .
xlab	X axis label using font and character expansion <code>par("font.lab")</code> and color <code>par("col.lab")</code> .
ylab	Y axis label, same font attributes as xlab.
mar	A numerical vector of the form <code>c(bottom, left, top, right)</code> which gives the number of lines of margin to be specified on the four sides of the plot. The default is <code>c(1, 3, 5, 1, 2)</code> .
plot	default is TRUE, plot the estimates.
add	if add=TRUE, plot over the existing plot. default is FALSE.
offset	add extra spaces to separate from the existing dots. default is 0.1.
var.idx	the index of the variables of a bugs object, default is NULL which will plot all the variables.
intercept	If TRUE will plot intercept, default=FALSE to get better presentation.

Details

This function plots coefficients from bugs, lm, glm and polr with 1 sd and 2 sd interval bars.

Value

Plot of the coefficients from a bugs, lm or glm fit. You can add the intercept, the variable names and the display the result of the fitted model.

contrast.bayes	<i>Contrast Matrices</i>
----------------	--------------------------

Description

Return a matrix of contrasts used in [bayesglm](#).

Usage

```
contr.bayes.unordered(n, base = 1, contrasts = TRUE)
contr.bayes.ordered (n, scores = 1:n, contrasts = TRUE)
```

Arguments

n	a vector of levels for a factor, or the number of levels.
base	an integer specifying which group is considered the baseline group. Ignored if contrasts is FALSE.
contrasts	a logical indicating whether contrasts should be computed.
scores	the set of values over which orthogonal polynomials are to be computed.

Details

These functions are adapted from `contr.treatment` and `contr.poly` in [stats](#) package. The purpose for these functions are to keep the baseline levels of categorical variables and thus to suit the use of [bayesglm](#).

`contr.bayes.unordered` is equivalent to `contr.treatment` whereas `contr.bayes.ordered` is equivalent to `contr.poly`.

Author(s)

Yu-Sung Su <suyusung@tsinghua.edu.cn>

[C](#), [contr.helmert](#), [contr.poly](#), [contr.sum](#), [contr.treatment](#); [glm](#), [aov](#), [lm](#), [bayesglm](#).

Examples

```
cat.var <- rep(1:3, 5)
dim(contr.bayes.unordered(cat.var))
# 15*15 baseline level kept!
dim(contr.treatment(cat.var))
# 15*14
```

`corrplot`*Correlation Plot*

Description

Function for making a correlation plot starting from a data matrix

Usage

```
corrplot (data, varnames=NULL, cutpts=NULL,  
          abs=TRUE, details=TRUE,  
          n.col.legend=5, cex.col=0.7,  
          cex.var=0.9, digits=1, color=FALSE)
```

Arguments

<code>data</code>	a data matrix
<code>varnames</code>	variable names of the data matrix, if not provided use default variable names
<code>abs</code>	if TRUE, transform all correlation values into positive values, default=TRUE.
<code>cutpts</code>	a vector of cutting points for color legend, default is NULL. The function will decide the cutting points if cutpts is not assigned.
<code>details</code>	show more than one digits correlaton values. Default is TRUE. FALSE is suggested to get readable output.
<code>n.col.legend</code>	number of legend for the color thermometer.
<code>cex.col</code>	font size of the color thermometer.
<code>cex.var</code>	font size of the variable names.
<code>digits</code>	number of digits shown in the text of the color thermoeter.
<code>color</code>	color of the plot, default is FALSE, which uses gray scale.

Details

The function adapts the R function for Figure 8 in Tian Zheng, Matthew Salganik, and Andrew Gelman, 2006, "How many people do you know in prison?: using overdispersion in count data to estimate social structure in networks", Journal of the American Statistical Association, Vol.101, N0. 474: p.409-23.

Value

A correlation plot.

Author(s)

Tian Zheng <tzheng@stat.columbia.edu>; Yu-Sung Su <suyusung@tsinghua.edu.cn>

par(old.par)
```

Description

Creates a prettier histogram for discrete distributions

Usage

```
discrete.histogram (x, prob, prob2=NULL, prob3=NULL,
  xlab="x", xaxis.label=NULL, yaxis.label=NULL, bar.width=NULL,
  freq=FALSE, prob.col="blue", prob2.col="red", prob3.col="gray", ...)
```

Arguments

x	The vector of x's
prob	The probabilities for the x's
prob2	A second vector of probabilities of the x's
prob3	A third vector of probabilities of the x's
xlab	Label for the x axis
xaxis.label	Label for the x's
yaxis.label	Label for the y axis
bar.width	Width of the bars
freq	If TRUE, shows a frequency histogram as opposed to probability.
prob.col	The color of the first set of histogram bars.
prob2.col	The color of the second set of histogram bars.
prob3.col	The color of the third set of histogram bars.
...	Additional arguments passed to function plot

Details

This function displays a histogram for discrete probability distributions.

Examples

```
a <- c(3,4,0,0,5,1,1,1,1,0)
discrete.histogram (a)

x <- c(0,1,3,4,5)
p <- c(.3,.4,.1,.1,.1)
discrete.histogram (x,p)

x <- c(0,1,3,4,5)
y <- c(3,4,1,1,1)
discrete.histogram (x,y)
```

Description

This generic function gives a clean printout of lm, glm, mer, polr and svyglm objects.

Usage

```
display (object, ...)  
  
## S4 method for signature 'lm'  
display(object, digits=2, detail=FALSE)  
## S4 method for signature 'bayesglm'  
display(object, digits=2, detail=FALSE)  
  
## S4 method for signature 'glm'  
display(object, digits=2, detail=FALSE)  
## S4 method for signature 'merMod'  
display(object, digits=2, detail=FALSE)  
## S4 method for signature 'polr'  
display(object, digits=2, detail=FALSE)  
## S4 method for signature 'svyglm'  
display(object, digits=2, detail=FALSE)
```

Arguments

object	The output of a call to lm, glm, mer, polr, svyglm or related regressions function with n data points and k predictors.
...	further arguments passed to or from other methods.
digits	number of significant digits to display.
detail	default is FALSE, if TRUE, display p-values or z-values

Details

This generic function gives a clean printout of lm, glm, mer and polr objects, focusing on the most pertinent pieces of information: the coefficients and their standard errors, the sample size, number of predictors, residual standard deviation, and R-squared. Note: R-squared is automatically displayed to 2 digits, and deviances are automatically displayed to 1 digit, no matter what.

Value

Coefficients and their standard errors, the sample size, number of predictors, residual standard deviation, and R-squared

Note

Output are the model, the regression coefficients and standard errors, and the residual sd and R-squared (for a linear model), or the null deviance and residual deviance (for a generalized linear model).

```

 extractDIC

Extract AIC and DIC from a 'mer' model

Description

Computes the (generalized) Akaike *A*ⁿ *I*ⁿformation *C*ⁿriterion and *D*ⁿeviance *I*ⁿformation *C*ⁿriterion for a mer model.

Usage

```
extractDIC(fit,...)
## S3 method for class 'merMod'
extractDIC(fit,...)
```

Arguments

`fit` fitted merMod mode, usually the result of a fitter like merMod.
`...` further arguments (currently unused).

Author(s)

Andrew Gelman <gelman@stat.columbia.edu>; Yu-Sung Su <suyusung@tsinghua.edu.cn>

Examples

```
fm1 <- lmer(Reaction ~ Days + (Days|Subject), sleepstudy)
extractAIC(fm1)
extractDIC(fm1)
```

 fround

Formating the Rounding of Numbers

Description

fround rounds the values in its first argument to the specified number of decimal places with surrounding quotes.

pfround rounds the values in its first argument to the specified number of decimal places without surrounding quotes.

Usage

```
fround(x, digits)
pfround(x, digits)
```

Arguments

x a numeric vector.
 digits integer indicating the precision to be used.

Author(s)

Andrew Gelman <gelman@stat.columbia.edu>; Yu-Sung Su <suyusung@tsinghua.edu.cn>

See Also

[round](#)

Examples

```
x <- rnorm(1)
fround(x, digits=2)
pfround(x, digits=2)
```

 GO

Function to Recall Last Source File

Description

A function that like `source()` but recalls the last source file names by default.

Usage

```
go(..., add=FALSE, timer=FALSE)
```

Arguments

... list of filenames as character strings.
 add add these names to the current list; if replace, then FALSE.
 timer time the execution time of `go()`.

Author(s)

Jouni Kerman <jouni@kerman.com> <kerman@stat.columbia.edu>

Examples

```
go('myprog')            # will run source('myprog.r')
go()                    # will run source('myprog.r') again
go('somelib',add=TRUE) # will run source('myprog.r') and source('somelib.r')
go('myprog','somelib') # same as above
go('mytest')            # will run source('mytest') only
go()                    # runs source('mytest') again
G                        # short cut to call go()
```

`invlogit`*Logistic and Inverse logistic functions*

Description

Inverse-logit function, transforms continuous values to the range (0, 1)

Usage

```
logit(x)
invlogit(x)
```

Arguments

`x` A vector of continuous values

Details

The Inverse-logit function defined as: $\text{logit}^{-1}(x) = e^x / (1 + e^x)$ transforms continuous values to the range (0, 1), which is necessary, since probabilities must be between 0 and 1 and maps from the linear predictor to the probabilities

Value

A vector of estimated probabilities

Author(s)

Andrew Gelman <gelman@stat.columbia.edu>, M.Grazia Pittau <grazia@stat.columbia.edu>

References

Andrew Gelman and Jennifer Hill. (2006). *Data Analysis Using Regression and Multilevel/Hierarchical Models*. Cambridge University Press.

Examples

```
data(frisk)
n <- 100
x1 <- rnorm (n)
x2 <- rbinom (n, 1, .5)
b0 <- 1
b1 <- 1.5
b2 <- 2
Inv.logit <- invlogit(b0+b1*x1+b2*x2)
plot(b0+b1*x1+b2*x2, Inv.logit)
```

lalonge

Lalonge Dataset

Description

Dataset used by Dehejia and Wahba (1999) to evaluate propensity score matching.

Usage

```
data(lalonge)
```

Format

A data frame with 445 observations on the following 12 variables.

age age in years.

educ years of schooling.

black indicator variable for blacks.

hisp indicator variable for Hispanics.

married indicator variable for marital status.

nodegr indicator variable for high school diploma.

re74 real earnings in 1974.

re75 real earnings in 1975.

re78 real earnings in 1978.

u74 indicator variable for earnings in 1974 being zero.

u75 indicator variable for earnings in 1975 being zero.

treat an indicator variable for treatment status.

Details

Two demos are provided which use this dataset. The first, DehejiaWahba, replicates one of the models from Dehejia and Wahba (1999). The second demo, AbadieImbens, replicates the models produced by Abadie and Imbens https://scholar.harvard.edu/imbens/scholar_software/matching-estimators. Many of these models are found to produce good balance for the Lalonde data.

Note

This documentation is adapted from Matching package.

```

matching	<i>Single Nearest Neighborhood Matching</i>
----------	---

Description

Function for processing matching with propensity score

Usage

```
matching(z, score, replace=FALSE)
```

Arguments

z	vector of indicators for treatment or control.
score	vector of the propensity scores in the same order as z.
replace	whether the control units could be reused for matching, default is FALSE.

Details

Function for matching each treatment unit in turn the control unit (not previously chosen) with the closest propensity score

Value

The function returns a vector of indices that the corresponding unit is matched to. 0 means matched to nothing.

```

mcsamp

*Generic Function to Run 'mcmcsamp()' in lme4***Description**

The quick function for MCMC sampling for lmer and glmer objects and convert to Bugs objects for easy display.

Usage

```
## Default S3 method:
mcsamp(object, n.chains=3, n.iter=1000, n.burnin=floor(n.iter/2),
        n.thin=max(1, floor(n.chains * (n.iter - n.burnin)/1000)),
        saveb=TRUE, deviance=TRUE, make.bugs.object=TRUE)
## S4 method for signature 'merMod'
mcsamp(object, ...)
```

Arguments

object	mer objects from lme4
n.chains	number of MCMC chains
n.iter	number of iteration for each MCMC chain
n.burnin	number of burnin for each MCMC chain, Default is <code>n.iter/2</code> , that is, discarding the first half of the simulations.
n.thin	keep every kth draw from each MCMC chain. Must be a positive integer. Default is <code>max(1, floor(n.chains * (n.iter-n.burnin) / 1000))</code> which will only thin if there are at least 2000 simulations.
saveb	if 'TRUE', causes the values of the random effects in each sample to be saved.
deviance	compute deviance for mer objects. Only works for lmer object

```

make.bugs.object
      transform the output into bugs object, default is TRUE
...      further arguments passed to or from other methods.

```

Details

This function generates a sample from the posterior distribution of the parameters of a fitted model using Markov Chain Monte Carlo methods. It automatically simulates multiple sequences and allows convergence to be monitored. The function relies on `mcmc` in `lme4`.

Value

An object of (S3) class `"bugs"` suitable for use with the functions in the "R2WinBUGS" package.

Examples

```

## Here's a simple example of a model of the form, y = a + bx + error,
## with 10 observations in each of 10 groups, and with both the intercept
## and the slope varying by group. First we set up the model and data.
##
# group <- rep(1:10, rep(10,10))
# group2 <- rep(1:10, 10)
# mu.a <- 0
# sigma.a <- 2
# mu.b <- 3
# sigma.b <- 4
# rho <- 0.56
# Sigma.ab <- array(c(sigma.a^2, rho*sigma.a*sigma.b,
#                    rho*sigma.a*sigma.b, sigma.b^2), c(2,2))
# sigma.y <- 1
# ab <- mvrnorm(10, c(mu.a,mu.b), Sigma.ab)
# a <- ab[,1]
# b <- ab[,2]
# d <- rnorm(10)
#
# x <- rnorm(100)
# y1 <- rnorm(100, a[group] + b*x, sigma.y)

```

```

# y2 <- rbinom(100, 1, prob=invlogit(a[group] + b*x))
# y3 <- rnorm (100, a[group] + b[group]*x + d[group2], sigma.y)
# y4 <- rbinom(100, 1, prob=invlogit(a[group] + b*x + d[group2]))
#
##
## Then fit and display a simple varying-intercept model:
#
# M1 <- lmer (y1 ~ x + (1|group))
# display (M1)
# M1.sim <- mcsamp (M1)
# print (M1.sim)
# plot (M1.sim)
##
## Then the full varying-intercept, varying-slope model:
##
# M2 <- lmer (y1 ~ x + (1 + x |group))
# display (M2)
# M2.sim <- mcsamp (M2)
# print (M2.sim)
# plot (M2.sim)
##
## Then the full varying-intercept, logit model:
##
# M3 <- lmer (y2 ~ x + (1|group), family=binomial(link="logit"))
# display (M3)
# M3.sim <- mcsamp (M3)
# print (M3.sim)
# plot (M3.sim)
##
## Then the full varying-intercept, varying-slope logit model:
##
# M4 <- lmer (y2 ~ x + (1|group) + (0+x |group),
#           family=binomial(link="logit"))
# display (M4)
# M4.sim <- mcsamp (M4)
# print (M4.sim)
# plot (M4.sim)
#
##
## Then non-nested varying-intercept, varying-slop model:
##
# M5 <- lmer (y3 ~ x + (1 + x |group) + (1|group2))
# display(M5)
# M5.sim <- mcsamp (M5)
# print (M5.sim)
# plot (M5.sim)

```

Description

model.matrixBayes creates a design matrix.

Usage

```
model.matrixBayes(object, data = environment(object),
  contrasts.arg = NULL, xlev = NULL, keep.order = FALSE, drop.baseline=FALSE,...)
```

Arguments

object	an object of an appropriate class. For the default method, a model formula or terms object.
data	a data frame created with <code>model.frame</code> . If another sort of object, <code>model.frame</code> is called first.
contrasts.arg	A list, whose entries are contrasts suitable for input to the <code>contrasts</code> replacement function and whose names are the names of columns of data containing <code>factors</code> .
xlev	to be used as argument of <code>model.frame</code> if data has no "terms" attribute.
keep.order	a logical value indicating whether the terms should keep their positions. If FALSE the terms are reordered so that main effects come first, followed by the interactions, all second-order, all third-order and so on. Effects of a given order are kept in the order specified.
drop.baseline	Drop the base level of categorical Xs, default is TRUE.
...	further arguments passed to or from other methods.

Details

model.matrixBayes is adapted from model.matrix in the stats package and is designed for the use of `bayesglm`. It is designed to keep baseline levels of all categorical variables and keep the variable names unsorted in the output. The design matrices created by model.matrixBayes are unidentifiable using classical regression methods, though; they can be identified using `bayesglm`.

class(ff) <- c("bayesglm", "terms", "formula")
(model.matrixBayes(ff, m))
```

multicomp.plot

Multiple Comparison Plot

Description

Plots significant difference of simulated array.

Usage

```
multicomp.plot(object, alpha = 0.05, main = "Multiple Comparison Plot",
  label = NULL, shortlabel = NULL, show.pvalue = FALSE,
  label.as.shortlabel = FALSE, label.on.which.axis = 3,
  col.low = "lightsteelblue", col.same = "white", col.high = "lightslateblue",
  vertical.line = TRUE, horizontal.line = FALSE,
  vertical.line.lty = 1, horizontal.line.lty = 1, mar=c(3.5,3.5,3.5,3.5))
```

Arguments

object	Simulated array of coefficients, columns being different variables and rows being simulated result.
alpha	Level of significance to compare.
main	Main label.
label	Labels for simulated parameters.
shortlabel	Short labels to put into the plot.
show.pvalue	Default is FALSE, if set to TRUE replaces short label with Bayesian p value.
label.as.shortlabel	Default is FALSE, if set to TRUE takes first 2 character of label and use it as short label.
label.on.which.axis	default is the 3rd (top) axis.
col.low	Color of significantly low coefficients.
col.same	Color of not significant difference.

col.high Color of significantly high coefficients.
 vertical.line Default is TRUE, if set to FALSE does not draw vertical line.
 horizontal.line Default is FALSE, if set to TRUE draws horizontal line.
 vertical.line.lty Line type of vertical line.
 horizontal.line.lty Line type of horizontal line.
 mar A numerical vector of the form c(bottom, left, top, right) which gives the number of lines of margin to be specified on the four sides of the plot. The default is c(3.5, 3.5, 3.5, 3.5).

Value

pvalue Array of Bayesian p value.
 significant Array of significance.

readColumns *Function to read data by columns*

Description

A function read data by columns

Usage

```
read.columns(filename, columns)
```

Arguments

filename	user specified file name including path of the file
columns	which columns of the data to be read

Author(s)

Andrew Gelman <gelman@stat.columbia.edu>

rescale *Function for Standardizing by Centering and Dividing by 2 sd's*

Description

This function standardizes a variable by centering and dividing by 2 sd's with exceptions for binary variables.

Usage

```
rescale(x, binary.inputs="center")
```

Arguments

x	a vector
binary.inputs	options for standardizing binary variables, default is center; 0/1 keeps original scale; -0.5, 0.5 rescales 0 as -0.5 and 1 as 0.5; center subtracts the mean; and full subtracts the mean and divides by 2 sd.

Value

the standardized vector

Author(s)

Andrew Gelman <gelman@stat.columbia.edu>; Yu-Sung Su <suyusung@tsinghua.edu.cn>

References

Andrew Gelman. (2008). “Scaling regression inputs by dividing by two standard deviations”. *Statistics in Medicine* 27: 2865–2873. <http://www.stat.columbia.edu/~gelman/research/published/standardizing7.pdf>

[standardize](#)

Examples

```
# Set up the fake data
n <- 100
x <- rnorm (n, 2, 1)
x1 <- rnorm (n)
x1 <- (x1-mean(x1))/(2*sd(x1)) # standardization
x2 <- rbinom (n, 1, .5)
b0 <- 1
b1 <- 1.5
b2 <- 2
y <- rbinom (n, 1, invlogit(b0+b1*x1+b2*x2))
rescale(x, "full")
rescale(y, "center")
```

residual.plot

residual plot for the observed values

Description

Plots the residual of observed variable.

Usage

```
residual.plot(Expected, Residuals, sigma, main = deparse(substitute(Expected)),
  col.pts = "blue", col.ctr = "red", col.sgm = "black", cex = 0.5,
  gray.scale = FALSE, xlab = "Predicted", ylab = "Residuals", ...)
```

Arguments

Expected	Expected value.
Residuals	Residual value.
sigma	Standard error.
main	main for the plot. See plot for detail.

col.pts	Color of the points.
col.ctr	Color of the line at zero.
col.sgm	Color of standard error line.
cex	A numerical value giving the amount by which plotting text and symbols should be magnified relative to the default. See par for detail.
gray.scale	If TRUE, makes the plot into black and white. This option overwrites the color specification. Default is FALSE.
xlab	Label for x axis.
ylab	Label for y axis.
...	Additional parameters passed to plot function.

Value

Plot to visualize pattern of residual value for the expected value.

Masanao Yajima <yajima@stat.columbia.edu>, M.Grazia Pittau <grazia@stat.columbia.edu>

Examples

```
old.par <- par(no.readonly = TRUE)

x <- rnorm(100)
y <- rnorm(100)
fit <- lm(y~x)
y.hat <- fitted(fit)
u <- resid(fit)
sigma <- sigma.hat(fit)
residual.plot(y.hat, u, sigma)

par(old.par)
```

se.coef

Extract Standard Errors of Model Coefficients

Description

These functions extract standard errors of model coefficients from objects returned by modeling functions.

Usage

```
se.coef (object, ...)  
se.fixef (object)  
se.ranef (object)  
  
## S4 method for signature 'lm'  
se.coef(object)  
## S4 method for signature 'glm'  
se.coef(object)  
## S4 method for signature 'merMod'  
se.coef(object)
```

Arguments

object	object of lm, glm and merMod fit
...	other arguments

Details

se.coef extracts standard errors from objects returned by modeling functions. se.fixef extracts standard errors of the fixed effects from objects returned by lmer and glmer functions. se.ranef extracts standard errors of the random effects from objects returned by lmer and glmer functions.

Value

se.coef gives lists of standard errors for coef, se.fixef gives a vector of standard errors for fixef and se.ranef gives a list of standard errors for ranef.

Functions to Get Posterior Distributions

Description

This generic function gets posterior simulations of sigma and beta from a `lm` object, or simulations of beta from a `glm` object, or simulations of beta from a `merMod` object

Usage

```
sim(object, ...)

## S4 method for signature 'lm'
sim(object, n.sims = 100)
## S4 method for signature 'glm'
sim(object, n.sims = 100)
## S4 method for signature 'polr'
sim(object, n.sims = 100)
## S4 method for signature 'merMod'
sim(object, n.sims = 100)

## S3 method for class 'sim'
coef(object,...)
## S3 method for class 'sim.polr'
coef(object, slot=c("ALL", "coef", "zeta"),...)
## S3 method for class 'sim.merMod'
coef(object,...)
## S3 method for class 'sim.merMod'
fixef(object,...)
## S3 method for class 'sim.merMod'
ranef(object,...)
## S3 method for class 'sim.merMod'
fitted(object, regression,...)
```

Arguments

<code>object</code>	the output of a call to <code>lm</code> with <code>n</code> data points and <code>k</code> predictors.
<code>slot</code>	return which slot of <code>sim.polr</code> , available options are <code>coef</code> , <code>zeta</code> , <code>ALL</code> .
<code>...</code>	further arguments passed to or from other methods.
<code>n.sims</code>	number of independent simulation draws to create.
<code>regression</code>	the orginial mer model

Value

coef	matrix (dimensions n.sims x k) of n.sims random draws of coefficients.
zeta	matrix (dimensions n.sims x k) of n.sims random draws of zetas (cut points in polr).
fixef	matrix (dimensions n.sims x k) of n.sims random draws of coefficients of the fixed effects for the merMod objects. Previously, it is called unmodeled.
sigma	vector of n.sims random draws of sigma (for glm's, this just returns a vector of 1's or else of the square root of the overdispersion parameter if that is in the model)

```

standardize	<i>Function for Standardizing Regression Predictors by Centering and Dividing by 2 sd's</i>
-------------	---

Description

Numeric variables that take on more than two values are each rescaled to have a mean of 0 and a sd of 0.5; Binary variables are rescaled to have a mean of 0 and a difference of 1 between their two categories; Non-numeric variables that take on more than two values are unchanged; Variables that take on only one value are unchanged

Usage

```
## S4 method for signature 'lm'
standardize(object, unchanged = NULL,
            standardize.y = FALSE, binary.inputs = "center")
## S4 method for signature 'glm'
standardize(object, unchanged = NULL,
            standardize.y = FALSE, binary.inputs = "center")
## S4 method for signature 'merMod'
standardize(object, unchanged = NULL,
            standardize.y = FALSE, binary.inputs = "center")
## S4 method for signature 'polr'
standardize(object, unchanged = NULL,
            standardize.y = FALSE, binary.inputs = "center")
```

Arguments

object	an object of class lm or glm
unchanged	vector of names of parameters to leave unstandardized
standardize.y	if TRUE, the outcome variable is standardized also
binary.inputs	options for standardizing binary variables

Details

"0/1" (rescale so that the lower value is 0 and the upper is 1) "-0.5/0.5" (rescale so that the lower value is -0.5 and upper is 0.5) "center" (rescale so that the mean of the data is 0 and the difference between the two categories is 1) "full" (rescale by subtracting the mean and dividing by 2 sd's) "leave.alone" (do nothing)

# M2.1 & M2.2 should be the same
```

traceplot

Trace plot of 'bugs' object

Description

Displays a plot of iterations *vs.* sampled values for each variable in the chain, with a separate plot per variable.

Usage

```
## S4 method for signature 'bugs'
traceplot( x, mfrow = c( 1, 1 ), varname = NULL,
  match.head = TRUE, ask = TRUE,
  col = rainbow( x$n.chains ),
  lty = 1, lwd = 1, ...)
```

Arguments

x	A bugs object
mfrow	graphical parameter (see par)
varname	vector of variable names to plot
match.head	matches the variable names by the beginning of the variable names in bugs object
ask	logical; if TRUE, the user is <i>asked</i> before each plot, see par(ask=.).
col	graphical parameter (see par)
lty	graphical parameter (see par)
lwd	graphical parameter (see par)
...	further graphical parameters

Triangle Plot

Description

Function for making a triangle plot from a square matrix

Usage

```
triangleplot (x, y=NULL, cutpts=NULL, details=TRUE,
  n.col.legend=5, cex.col=0.7,
  cex.var=0.9, digits=1, color=FALSE)
```

Arguments

x	a square matrix.
y	a vector of names that corresponds to each element of the square matrix x.
cutpts	a vector of cutting points for color legend, default is NULL. The function will decide the cutting points if cutpts is not assigned.
details	show more than one digits correlaton values. Default is TRUE. FALSE is suggested to get readable output.
n.col.legend	number of legend for the color thermometer
cex.col	font size of the color thermometer.
cex.var	font size of the variable names.
digits	number of digits shown in the text of the color theromoeter.
color	color of the plot, default is FALSE, which uses gray scale.

Details

The function makes a triangle plot from a square matrix, e.g., the correlation plot, see [corrplot](#). If a square matrix contains missing values, the cells of missing values will be marked x.

Examples

```
old.par <- par(no.readonly = TRUE)

# create a square matrix
x <- matrix(runif(1600), 0, 1), 40, 40)

# fig 1
triangleplot(x)

# fig 2 assign cutting points
triangleplot(x, cutpts=c(0,0.25,0.5,0.75,1), digits=2)

# fig 3 if x contains missing value
x[12,13] <- x[13,12] <- NA
x[25,27] <- x[27,25] <- NA
triangleplot(x)

par(old.par)

#
#library(RColorBrewer)
```

```
#cormat <- cor(iris[,-5])  
#triangleplot2(cormat,color = brewer.pal( 5, "RdBu" ),  
# n.col.legend=5, cex.col=0.7, cex.var=0.5)
```
