

Package ‘tidySEM’

May 1, 2023

Type Package

Title Tidy Structural Equation Modeling

Version 0.2.4

Description A tidy workflow for generating, estimating, reporting, and plotting structural equation models using 'lavaan', 'OpenMx', or 'Mplus'. Throughout this workflow, elements of syntax, results, and graphs are represented as 'tidy' data, making them easy to customize.

License GPL (>= 3)

URL <https://cjvanlissa.github.io/tidySEM/>

BugReports <https://github.com/cjvanlissa/tidySEM/issues>

Depends R (>= 4.0.0), stats, utils, OpenMx

Imports ggplot2, lavaan, blavaan, MplusAutomation, igraph, psych, methods, gtable, dbscan, RANN, Matrix, bain, car, future.apply, progressr

Suggests testthat, knitr, rmarkdown, dplyr, stringr, covr, tidyLPA, poLCA, umx, mclust, MASS, scales, yaml, formatR

VignetteBuilder knitr

Encoding UTF-8

RoxygenNote 7.2.3

LazyData true

NeedsCompilation no

|-----------|---------------------------------------------------|
| add_paths | <i>Add paths to an object of class 'tidy_sem'</i> |
|-----------|---------------------------------------------------|

Description

Add paths to an object of class `tidy_sem`, or replace existing paths. The paths must be specified as `model.syntax`, and separated by commas.

Usage

```
add_paths(model, ...)
```

Arguments

| | |
|--------------------|-------------------------------------------------------------------------------------------------------|
| <code>model</code> | An object of class <code>tidy_sem</code> . |
| <code>...</code> | Paths to add or substitute, specified in <code>lavaan{model.syntax}</code> , and separated by commas. |

Details

Currently, only the `lavaan{lavaan}` commands `~`, `~~`, `=~`, and `~1` are parsed.

This function relies on `lavaan` `model.syntax` to convert syntax strings to `lavaan` parameter tables. By default, it uses the arguments `int.ov.free = TRUE`, `int.lv.free = FALSE`, `auto.fix.first = TRUE`, `auto.fix.single = TRUE`, `auto.var = TRUE`, `auto.cov.lv.x = TRUE`, `auto.efa = TRUE`, `auto.th = TRUE`, `auto.delta = TRUE`, `auto.cov.y = TRUE`, `meanstructure = TRUE`, in a similar way to `sem` and `cfa`.

Value

An object of class `tidy_sem`.

See Also

[model.syntax](#)

Examples

```
library(lavaan)
df <- iris[, 1:4]
names(df) <- paste0("x_", 1:4)
model <- tidy_sem(df)
model <- measurement(model)
model <- add_paths(model, x =~ a*x_1 + b*x_2 + a*x_3 + b*x_4)
res <- estimate_lavaan(model)
summary(res)
```

alkema_microplastics *Ocean Microplastics Data*

Description

These data were collected by Alkema during a cruise from 04/2018 to 06/2018 traversing the Atlantic Ocean from South Africa to Norway. A 500 micrometer meshed Manta Trawl was towed outside the wake of the ship for 1 h each day. Length, width, height and polymer type of 6.942 particles were measured using infrared spectroscopy and image analysis.

Usage

```
data(alkema_microplastics)
```

Format

A data frame with 6942 rows and 11 variables.

Details

| | | |
|-------------------|---------|------------------------------------------------------------------------------|
| current | factor | Which ocean current the sample was taken from |
| sample | integer | Sample ID |
| length | numeric | Particle length in mm |
| width | numeric | Particle width in mm |
| height_est | numeric | Estimated particle height in mm |
| height_obs | numeric | Observed particle height in mm. Height was only measured for large particles |
| category | factor | Particle category based on visual inspection |
| poly_type | factor | Polymer type as determined by near infrared spectroscopy (NIR) |
| two_dim | logical | Whether or not the particle can be treated as two-dimensional |
| film | logical | Whether or not the particle appears to be a film |
| line | logical | Whether or not the particle appears to be a line |

| | |
|-----------|--------------------------------------------|
| as_lavaan | <i>Convert tidy_sem to 'lavaan' syntax</i> |
|-----------|--------------------------------------------|

Description

Final stage in the 'tidySEM' workflow for syntax generation: Convert the tidy_sem object to lavaan syntax in tabular format (see [model.syntax](#)).

Usage

```
as_lavaan(x, ...)
```

Arguments

| | |
|-----|-----------------------------------------------------------|
| x | An object of class tidy_sem |
| ... | Additional parameters to be passed to and from functions. |

Value

Character vector.

Examples

```
mod <- list(syntax = structure(list(lhs = "x", op = "~", rhs = "y",
                                free = TRUE, value = "", label = "",
                                category = "", aspect = ""),
                              class = "data.frame", row.names = c(NA, -1L)))
class(mod) <- "tidy_sem"
as_lavaan(mod)
```

 as_mplus

Convert tidy_sem to 'Mplus' syntax

Description

Final stage in the 'tidySEM' workflow for syntax generation: Convert the tidy_sem object to 'Mplus' syntax.

Usage

```
as_mplus(x, ...)
```

Arguments

x An object of class tidy_sem.
 ... Additional parameters to be passed to and from functions.

Value

Character vector.

Examples

```
mod <- list(syntax = structure(list(lhs = "x", op = "~", rhs = "y",
                                free = TRUE, value = "", label = "",
                                category = "", aspect = ""),
                              class = "data.frame", row.names = c(NA, -1L)))
class(mod) <- "tidy_sem"
as_mplus(mod)
```

 as_ram

Convert lavaan syntax to RAM specification

Description

Converts SEM models to RAM models for OpenMx.

Usage

```
as_ram(x, ...)
```

Arguments

x An object for which a method exists, such as a tidy_sem object, or character vector describing the user-specified model using the lavaan model syntax.
 ... Parameters passed on to other functions.

Details

For models specified using lavaan syntax, the procedure is as follows:

1. Apply `lavaanify` to the model. The default arguments to `lavaanify` correspond to those of the `sem` function.
2. Convert each row of the resulting lavaan parameter table to a `mxPath`.
3. Apply `mxModel` to the `mxPaths` to create an OpenMx model using RAM specification

Value

Returns an `mxModel`.

Examples

```
as_ram("y ~ x")
```

BCH

Estimate an Auxiliary Model using the BCH Method

Description

Estimate an auxiliary model based on a latent classification by means of mixture modeling (see `mx_mixture`).

The auxiliary model is treated as a multi-group model. All cases are used in all groups, but they are weighted by group-specific BCH weights as described in Bolck, Croon, & Hagnaars, 2004.

Usage

```
BCH(x, model, data, ...)
```

Arguments

| | |
|--------------------|--------------------------------------------------------------------------------|
| <code>x</code> | An object for which a method exists. |
| <code>model</code> | An object that can be converted to an OpenMx model using <code>as_ram</code> . |
| <code>data</code> | A <code>data.frame</code> on which the auxiliary model can be evaluated. |
| <code>...</code> | further arguments to be passed to or from other methods. |

Value

An `MxModel`.

References

Bolck, A., Croon, M., & Hagnaars, J. (2004). Estimating latent structure models with categorical variables: One-step versus three-step estimators. *Political Analysis*, 12(1), 3–27. doi:10.2307/25791751

Examples

```
dat <- data.frame(x = iris$Petal.Length)
mixmod <- mx_profiles(dat,
                     classes = 2)
res <- BCH(mixmod, "y ~ 1", data = data.frame(y = iris$Sepal.Length))
```

 BLRT

Conduct Bootstrapped Likelihood Ratio Test

Description

Conduct Bootstrapped Likelihood Ratio Test to compare two mixture models.

Usage

```
BLRT(x, replications = 100, ...)
```

Arguments

| | |
|--------------|------------------------------------------------------------------------------|
| x | An object for which a method exists. |
| replications | Integer reflecting the number of bootstrapped replications, defaults to 100. |
| ... | further arguments to be passed to or from other methods. |

Value

A data.frame.

Examples

```
## Not run:
df <- iris[, 1, drop = FALSE]
names(df) <- "x"
res <- mx_mixture(model = "x ~ m{C}*1
                        x ~~ v{C}*x", classes = 1:2, data = df)
BLRT(res, replications = 4)

## End(Not run)
```

| | |
|------------|------------------------------------------|
| class_prob | <i>Obtain latent class probabilities</i> |
|------------|------------------------------------------|

Description

Obtain latent class probabilities for an object for which a method exists. See Details.

Usage

```
class_prob(  
  x,  
  type = c("sum.posterior", "sum.mostlikely", "mostlikely.class", "avg.mostlikely",  
           "individual"),  
  ...  
)
```

Arguments

| | |
|------|------------------------------------------------------------------------------------|
| x | An object for which a method exists. |
| type | Character vector, indicating which types of probabilities to extract. See Details. |
| ... | Further arguments to be passed to or from other methods. |

Details

The following types are available:

- "sum.posterior" A summary table of the posterior class probabilities; this indicates what proportion of your data contributes to each class.
- "sum.mostlikely" A summary table of the most likely class membership, based on the highest posterior class probability. Note that this is subject to measurement error.
- "mostlikely.class" If C is the true class of an observation, and N is the most likely class based on the model, then this table shows the probability $P(N==i|C==j)$. The diagonal represents the probability that observations in each class will be correctly classified.
- "avg.mostlikely" Average posterior probabilities for each class, for the subset of observations with most likely class of 1:k, where k is the number of classes.
- "individual" The posterior probability matrix, with dimensions n (number of cases in the data) x k (number of classes).

Value

A data.frame.

Examples

```
## Not run:
df <- iris[, 1, drop = FALSE]
names(df) <- "x"
res <- mx_mixture(model = "x ~ m{C}*1
                        x ~~ v{C}*x", classes = 1, data = df)

class_prob(res)

## End(Not run)
```

conf_int

Format confidence intervals

Description

Creates 'APA'-formatted confidence intervals, either from an object for which a method exists, or from the arguments lb and ub. When argument x is a numeric vector, it is also possible to construct a confidence interval using the standard error (se) and a percentile interval (ci).

Usage

```
conf_int(x, digits = 2, se = NULL, lb = NULL, ub = NULL, ci = 95)
```

Arguments

| | |
|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| x | Optional. An object for which a method exists. |
| digits | Integer. The number of digits to round the confidence boundaries to. |
| se | Optional, numeric. Standard error of the parameters. |
| lb | Optional, numeric. Lower boundary of confidence intervals. |
| ub | Optional, numeric. Upper boundary of confidence intervals. |
| ci | Optional, numeric. What percentage CI to use (only used when computing CI from a numeric vector x, and the standard error se, based on a normal distribution). |

Value

A character vector of formatted confidence intervals.

Author(s)

Caspar J. van Lissa

See Also

table_results est_sig

Other Reporting tools: [est_sig\(\)](#), [table_fit\(\)](#), [table_prob\(\)](#), [table_results\(\)](#)

Examples

```
conf_int(x = c(1.325, 2.432), se = c(.05336, .00325))
```

cors

Generate syntax for correlations

Description

Generate syntax for correlations between variables.

Usage

```
cors(x, ...)
```

Arguments

| | |
|-----|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| x | Object for which a method exists. If x is an object of class <code>tidy_sem</code> , then correlations between all observed and latent variables in the data dictionary of that object are computed, by default. If x is a character vector, all elements of the vector are used. |
| ... | Optional additional character vectors of variables to be correlated. If x is an object of class <code>tidy_sem</code> , then up to two vectors can be provided. If x is a vector, then one more optional vector can be provided. When no additional vectors of variable names are provided, only the correlations among the elements of x are returned. |

Value

An object of class `tidy_sem`.

Examples

```
dict <- tidy_sem(c("bfi_1", "bfi_2", "bfi_3", "bfi_4", "bfi_5"))
cors(dict, c("bfi_1", "bfi_2"))
```

create_scales *Create scale scores from observed variables*

Description

This function calculates mean or sum scores from a `data.frame` and a named list describing the items in each scale. It returns the scores, a scale descriptive table, and a scale correlation table. It relies on several functions from the `psych` package.

Usage

```
create_scales(
  x,
  keys.list,
  missing = TRUE,
  impute = "none",
  omega = NULL,
  digits = 2,
  ...
)

## S3 method for class 'tidy_sem'
create_scales(
  x,
  keys.list,
  missing = TRUE,
  impute = "none",
  omega = NULL,
  digits = 2,
  ...
)
```

Arguments

| | |
|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>x</code> | A <code>data.frame</code> containing all variables referenced in the <code>keys.list</code> , or an object of class <code>tidy_sem</code> . |
| <code>keys.list</code> | A named list, indicating which variables belong to which scale. |
| <code>missing</code> | Whether to use rows with partially missing values. Default: <code>TRUE</code> . |
| <code>impute</code> | Method for handling missing values, Default: <code>'none'</code> . This default method uses all available data to calculate scale scores, which is acceptable for mean scales, but not for sum scales. |
| <code>omega</code> | Which of McDonald's omega coefficients to report. Default: <code>NULL</code> ; valid options include: <code>"omega_h"</code> , <code>"omega_lim"</code> , <code>"alpha"</code> , <code>"omega_tot"</code> , <code>"G6"</code> . |
| <code>digits</code> | Number of digits for rounding, Default: <code>2</code> |
| <code>...</code> | Additional parameters to pass to and from functions. |

Details

For scales with less than 3 items, Cronbach's alpha might not be suitable as an estimate of reliability. For such scales, the Spearman-Brown reliability coefficient for two-item scales is computed, as described in Eisinga, R., Grotenhuis, M. te, & Pelzer, B. (2012). The reliability of a two-item scale: Pearson, Cronbach, or Spearman-Brown? *International Journal of Public Health*, 58(4), 637–642. doi:10.1007/s0003801204163. These coefficients are marked with "(sb)".

Value

List with elements: \$descriptives, \$correlations, and \$scores.

Examples

```
out <- create_scales(iris, keys.list = list(scalename =
  c("Sepal.Length", "Sepal.Width", "Petal.Length", "Petal.Width")))
out$descriptives
dict <- tidy_sem(iris, split = "\\.")
create_scales(dict)
```

 curry_mac

Simulated MAC data

Description

This simulated dataset, based on Curry et al., 2019, contains data on moral relevance and judgment across the seven domains of the Morality As Cooperation scale.

Usage

```
data(curry_mac)
```

Format

A data.frame with 1392 rows and 42 variables.

Details

| | | |
|--------------------|---------|----------------------------------------------------------------------|
| sex | factor | Self-identified sex of participants, Male, Female, or Transgendered. |
| age_years | numeric | Participants' age in years. |
| KinshipR | numeric | Mean score of moral relevance, kinship subscale. |
| MutualismR | numeric | Mean score of moral relevance, mutualism subscale. |
| ExchangeR | numeric | Mean score of moral relevance, exchange subscale. |
| HawkR | numeric | Mean score of moral relevance, hawk subscale. |
| DoveR | numeric | Mean score of moral relevance, dove subscale. |
| DivisionR | numeric | Mean score of moral relevance, division subscale. |
| PossessionR | numeric | Mean score of moral relevance, possession subscale. |
| KinshipJ | numeric | Mean score of moral judgment, kinship subscale. |

| | | |
|--------------------|---------|----------------------------------------------------|
| MutualismJ | numeric | Mean score of moral judgment, mutualism subscale. |
| ExchangeJ | numeric | Mean score of moral judgment, exchange subscale. |
| HawkJ | numeric | Mean score of moral judgment, hawk subscale. |
| DoveJ | numeric | Mean score of moral judgment, dove subscale. |
| DivisionJ | numeric | Mean score of moral judgment, division subscale. |
| PossessionJ | numeric | Mean score of moral judgment, possession subscale. |

data_mix_ordinal

Simulated data for mixture model with ordinal indicators

Description

This simulated dataset, based on the ‘Mplus’ User’s Guide example 7.6, contains four columns of integer data that should be treated as ordinal.

Usage

```
data(data_mix_ordinal)
```

Format

A data frame with 5000 rows and 4 variables.

Details

| | | |
|-----------|---------|--------------------------------------------|
| u1 | integer | Indicator 1, should be treated as ordinal. |
| u2 | integer | Indicator 2, should be treated as ordinal. |
| u3 | integer | Indicator 3, should be treated as ordinal. |
| u4 | integer | Indicator 4, should be treated as ordinal. |

| | |
|--------------|---------------------------|
| descriptives | <i>Describe a dataset</i> |
|--------------|---------------------------|

Description

Provide descriptive statistics for a dataset.

Usage

```
descriptives(x, ...)
```

Arguments

| | |
|------------------|--------------------------------------|
| <code>x</code> | An object for which a method exists. |
| <code>...</code> | Additional arguments. |

Value

A data.frame with descriptive statistics for x. Its elements are:

| | | |
|-------------------|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| name | Character | Variable name |
| type | character | Data type in R, as obtained by <code>class(x)[1]</code> |
| n | Integer | Number of valid observations |
| missing | Numeric | Proportion missing |
| unique | Integer | Number of unique values |
| mean | numeric | Mean value of non-missing entries, only defined for variables that can be coerced to numeric |
| median | numeric | Median value of non-missing entries, only defined for numeric variables |
| mode | Integer | For numeric variables: The mode value. For factors: The frequency of the mode value |
| mode_value | Character | For factors: value of the mode |
| sd | numeric | Standard deviation of non-missing entries, only defined for variables that can be coerced to numeric |
| v | numeric | Variability coefficient V for factor variables (Agresti, 1990). V is the probability that two independent observations are in the same category |
| min | numeric | Minimum value for numeric variables |
| max | numeric | Maximum value for numeric variables |
| range | numeric | Range (distance between min and max) for numeric variables |
| skew | numeric | Skewness. The normalized third central moment of a numeric variable, which reflects its skewness |
| skew_2se | numeric | Skewness, divided by two times its standard error. Values greater than one can be considered "significant" |
| kurt | numeric | Kurtosis. The normalized fourth central moment of a numeric variable, which reflects its peakedness |
| kurt_2se | numeric | Kurtosis, divided by two times its standard error. Values greater than one can be considered "significant" |

Examples

```
descriptives(iris)
```

| | |
|------------|-----------------------------------------|
| dictionary | <i>Extract dictionary from tidy_sem</i> |
|------------|-----------------------------------------|

Description

Provides access to the dictionary element of a tidy_sem object. This can be used to return or assign to the dictionary element.

Usage

```
dictionary(x)

dictionary(x) <- value
```

Arguments

| | |
|-------|----------------------------------|
| x | Object of class tidy_sem. |
| value | A valid value for dictionary(x). |

Value

data.frame

Examples

```
dict <- tidy_sem(iris, split = "\\.")
dictionary(dict)
```

| | |
|-------|-------------------------------------|
| edges | <i>Extract edges from sem_graph</i> |
|-------|-------------------------------------|

Description

Provides access to the edges element of a sem_graph object. This can be used to return or assign to the edges element.

Usage

```
edges(x)

edges(x) <- value
```

Arguments

| | |
|-------|-----------------------------|
| x | Object of class sem_graph. |
| value | A valid value for edges(x). |

Value

data.frame

Examples

```
edg <- data.frame(from = "x", to = "y")
p <- prepare_graph(edges = edg, layout = get_layout("x", "y", rows = 1))
edges(p)
```

edit_graph

Edit graph elements

Description

Evaluate an R expression within the environment of the elements of a `sem_graph` object, and return the modified `sem_graph`.

Usage

```
edit_graph(x, expr, element = c("edges", "nodes"), ...)
```

```
edit_nodes(x, expr, ...)
```

```
edit_edges(x, expr, ...)
```

Arguments

| | |
|----------------------|--------------------------------------------------------------------------------------------------------------|
| <code>x</code> | An object of class <code>sem_graph</code> . |
| <code>expr</code> | expression to evaluate. |
| <code>element</code> | Character. The element of the <code>sem_graph</code> to edit, defaults to <code>c("edges", "nodes")</code> . |
| <code>...</code> | Arguments passed on to <code>within</code> . |

Value

An object of class `sem_graph`.

Examples

```
p <- prepare_graph(layout = get_layout("x", rows = 1))
p <- edit_graph(p, {colour = "blue"}, element = "nodes")
plot(p)
```

empathy

*Simulated empathy data***Description**

This simulated dataset, based on Van Lissa et al., 2014, contains six annual assessments of adolescents' mean scores on the empathic concern and perspective taking subscales of the Interpersonal Reactivity Index (Davis, 1983). The first measurement wave occurred when adolescents were, on average, 13 years old, and the last one when they were 18 years old.

Usage

```
data(empathy)
```

Format

A data frame with 467 rows and 13 variables.

Details

| | | |
|------------|---------|--------------------------------------------|
| ec1 | numeric | Mean score of empathic concern in wave 1 |
| ec2 | numeric | Mean score of empathic concern in wave 2 |
| ec3 | numeric | Mean score of empathic concern in wave 3 |
| ec4 | numeric | Mean score of empathic concern in wave 4 |
| ec5 | numeric | Mean score of empathic concern in wave 5 |
| ec6 | numeric | Mean score of empathic concern in wave 6 |
| pt1 | numeric | Mean score of perspective taking in wave 1 |
| pt2 | numeric | Mean score of perspective taking in wave 2 |
| pt3 | numeric | Mean score of perspective taking in wave 3 |
| pt4 | numeric | Mean score of perspective taking in wave 4 |
| pt5 | numeric | Mean score of perspective taking in wave 5 |
| pt6 | numeric | Mean score of perspective taking in wave 6 |
| sex | factor | Adolescent sex; M = male, F = female. |

| | |
|-----------------|-----------------------------------------|
| estimate_lavaan | <i>Estimate tidy_sem using 'lavaan'</i> |
|-----------------|-----------------------------------------|

Description

This function is a wrapper for the [lavaan](#) estimating functions. By default, the wrapper uses [sem](#), but users can also specify [lavaan](#), [cfa](#), or [growth](#).

Usage

```
estimate_lavaan(x, func = "sem", ...)
```

Arguments

| | |
|------|-------------------------------------------------------------------------|
| x | An object of class <code>tidy_sem</code> . |
| func | The lavaan modeling function to invoke, Default: 'sem'. |
| ... | Additional parameters passed to the estimating function. |

Value

An object of class `lavaan`.

Examples

```
library(lavaan)
model <- tidy_sem(iris, "\\.")
model <- measurement(model)
res <- estimate_lavaan(model)
summary(res)
```

| | |
|----------------|----------------------------------------|
| estimate_mplus | <i>Estimate tidy_sem using 'Mplus'</i> |
|----------------|----------------------------------------|

Description

This function is a wrapper for the functions [mplusObject](#) and [mplusModeler](#). Using this function requires 'Mplus' to be installed.

Usage

```
estimate_mplus(x, ...)
```

Arguments

`x` An object of class `tidy_sem`.

`...` Additional parameters passed to `mplusObject` and `mplusModeler`. These arguments are matched to the correct function by name. The arguments `rdata`, and `MODEL` cannot be edited, as they are determined from the `tidy_sem` object.

Details

The arguments `dataout`, `modelout`, and `run` are optional. If these are not specified, the model will be run in `tempdir`.

Value

An object of class `mplusObject`.

Examples

```
library(MplusAutomation)
model <- tidy_sem(iris, "\\.")
model <- measurement(model)
## Not run:
  estimate_mplus(model, run = 0L)

## End(Not run)
```

estimate_mx

Estimate tidy_sem using 'OpenMx'

Description

This function is a wrapper for the `as_ram` and `run_mx` functions.

Usage

```
estimate_mx(x, ...)
```

Arguments

`x` An object of class `tidy_sem`.

`...` Additional parameters passed to the estimating function.

Value

An object of class `MxModel`.

Examples

```
df <- iris[1:4]
names(df) <- paste0("x_", 1:4)
model <- tidy_sem(df)
model <- measurement(model)
res <- estimate_mx(model)
summary(res)
```

| | |
|---------|---------------------------------------------|
| est_sig | <i>Add significance asterisks to object</i> |
|---------|---------------------------------------------|

Description

Takes an object, and adds significance asterisks.

Usage

```
est_sig(x, digits = 2, sig = NULL)
```

Arguments

| | |
|--------|---------------------------------------------------------------------------------------------|
| x | An object for which a method exists. This will be treated as numeric by the default method. |
| digits | Integer. The number of digits to round the estimate column to. |
| sig | Optional, a vector of p-values for the default method. |

Value

A character vector of formatted estimates.

Author(s)

Caspar J. van Lissa

See Also

`table_results`

Other Reporting tools: [conf_int\(\)](#), [table_fit\(\)](#), [table_prob\(\)](#), [table_results\(\)](#)

Examples

```
est_sig(c(.222, .3333), sig = c(.054, .045))
```

| | |
|----------|-----------------------------------|
| get_data | <i>Extract data from tidy_sem</i> |
|----------|-----------------------------------|

Description

Provides access to the data element of a tidy_sem object. This can be used to return or assign to the data element.

Usage

```
get_data(x)

get_data(x) <- value
```

Arguments

| | |
|-------|--------------------------------|
| x | Object of class tidy_sem. |
| value | A valid value for get_data(x). |

Value

data.frame

Examples

```
dict <- tidy_sem(iris, split = "\\.")
get_data(dict)
```

| | |
|-----------|----------------------------------------------|
| get_edges | <i>Extract edges from a SEM model object</i> |
|-----------|----------------------------------------------|

Description

Attempts to extract edges from a SEM model object, where edges are defined as regression paths and covariances between variables (nodes).

Usage

```
get_edges(x, label = "est_sig", ...)
```

Arguments

| | |
|-------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| x | A model object of class <code>mplusObject</code> or <code>lavaan</code> . |
| label | Either a character, indicating which column to use for edge labels, or an expression. See Details. Defaults to "est_sig", which labels edges with the estimated value with significance asterisks, as obtained from <code>table_results</code> . See Details and examples for more information. |
| ... | Additional parameters passed to <code>table_results</code> . For example, users can pass the <code>digits</code> argument to control the number of digits in the edge label, or pass the <code>columns</code> argument to retain auxiliary columns in the <code>tidy_edges</code> <code>data.frame</code> for further processing (see Examples). |

Details

The function `get_edges` identifies all regression paths, latent variable definitions, and covariances in the model as edges. The output of `table_results` for those paths is used to label the edges.

Custom labels:

One way to create custom edge labels is by passing an expression to `label`. When an expression is passed to `label`, it is evaluated in the context of a `data.frame` containing the results of a call to `table_results` on the `x` argument.

Another way to create custom labels is by requesting auxiliary variables using the `columns` argument (which is passed to `table_results`), and then using these columns to construct a new label. See examples.

Value

An object of class 'tidy_edges'

Examples

```
# Standard use
library(lavaan)
res <- sem("dist ~ speed", cars)
get_edges(res)

# Pass an expression to the 'label' argument for custom labels
get_edges(res, label = paste(est_sig, confint))

# Pass the argument 'columns' to table_results through '...' to retain
# auxiliary columns for further processing
edg <- get_edges(res, columns = c("est_sig", "confint"))
edg
edg <- within(edg, {label <- paste(est_sig, confint)})
edg
```

| | |
|---------|-------------------------------------|
| get_fit | <i>Get fit indices from objects</i> |
|---------|-------------------------------------|

Description

Get fit indices from objects for which a method exists.

Usage

```
get_fit(x, ...)
```

Arguments

| | |
|-----|----------------------------------------------------------|
| x | An object for which a method exists. |
| ... | further arguments to be passed to or from other methods. |

Value

A data.frame.

Examples

```
## Not run:
df <- iris[, 1, drop = FALSE]
names(df) <- "x"
res <- mx_mixture(model = "x ~ m{C}*1
                        x ~~ v{C}*x", classes = 1, data = df)
table_fit(res)

## End(Not run)
```

| | |
|-------------------|------------------------------|
| get_layout.lavaan | <i>Generate graph layout</i> |
|-------------------|------------------------------|

Description

Generate a tidy_layout for a SEM graph.

Usage

```
## S3 method for class 'lavaan'
get_layout(x, ..., layout_algorithm = "layout_as_tree")

get_layout(x, ...)

## Default S3 method:
get_layout(x, ..., rows = NULL)
```

Arguments

| | |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| x | An object for which a method exists; currently, methods exist for character, lavaan, and mplus.model objects. |
| ... | Character arguments corresponding to layout elements. Use node names, empty strings (""), or NA values. |
| layout_algorithm | Optional argument for fit model objects. Character string, indicating which igraph layout algorithm to apply to position the nodes. Defaults to "layout_as_tree"; see details for more options. |
| rows | Numeric, indicating the number of rows of the graph. |

Details

There are three ways to generate a layout:

1. Specify the layout in the call to `get_layout()` by providing node names and the number of rows to create a layout matrix. Empty strings ("") or NA can be used for empty cells. See Example 1.
2. Call `get_layout()` on a model object or `tidy_results` object. It will use the function [layout_as_tree](#), or any other layout function from the `igraph` package, to generate a rudimentary layout. See Example 2.
3. Instead of using `get_layout()`, just use a matrix or `data.frame` with your layout. For example, specify the layout in a spreadsheet program, and load it into R (see Example 3). Or, copy the layout to the clipboard from your spreadsheet program, and load it from the clipboard (see Example 4)

The layout algorithms imported from `igraph` are: `c("layout_as_star", "layout_as_tree", "layout_in_circle", "layout_nicely", "layout_on_grid", "layout_randomly", "layout_with_dh", "layout_with_fr", "layout_with_gem", "layout_with_graphopt", "layout_with_kk", "layout_with_lgl", "layo`. These can be used by specifying the optional argument `layout_algorithm = ""`.

Value

Object of class 'tidy_layout'

Examples

```
# Example 1
get_layout("c", NA, "d",
           NA, "e", NA, rows = 2)

# Example 2
library(lavaan)
fit <- cfa('visual =~ x1 + x2 + x3 ',
          data = HolzingerSwineford1939[1:50, ])
get_layout(fit)

## Not run:
# Example 3
```

```

# Here, we first write the layout to .csv, but you could create it in a
# spreadsheet program, and save the spreadsheet to .csv:
write.csv(matrix(c("c", "", "d", "", "e", ""), nrow = 2, byrow = TRUE),
           file = file.path(tempdir(), "example3.csv"), row.names = FALSE)
# Now, we load the .csv:
read.csv(file.path(tempdir(), "example3.csv"))

# Example 4
# For this example, make your layout in a spreadsheet program, select it, and
# copy to clipboard. Reading from the clipboard works differently in Windows
# and Mac. For this example, I used Microsoft Excel.
# On Windows, run:
read.table("clipboard", sep = "\t")
# On Mac, run:
read.table(pipe("pbpaste"), sep="\t")

## End(Not run)

```

get_nodes

Extract nodes from a SEM model object

Description

Attempts to extract nodes from a SEM model object, where nodes are defined as observed or latent variables.

Usage

```
get_nodes(x, label = paste2(name, est_sig, sep = "\n"), ...)
```

Arguments

| | |
|-------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| x | A model object of class <code>mplusObject</code> or <code>lavaan</code> . |
| label | Either a character, indicating which column to use for node labels, or an expression. See Details. Defaults to <code>paste(name, est_sig, sep = "\n")</code> , which gives the node name followed by the estimated value with significance asterisks. |
| ... | Additional parameters passed to <code>table_results</code> . For example, users can pass the <code>digits</code> argument to control the number of digits in the node label, or pass the <code>columns</code> argument to retain auxiliary columns in the <code>tidy_nodes</code> data.frame for further processing (see Examples). |

Details

The function `get_nodes` identifies all dependent and independent variables in the model as nodes. If a mean structure / intercepts are included in the model, the output of `table_results` for those means / intercepts is used to label the nodes.

Custom labels:

One way to create custom node labels is by passing an expression to `label`, as in the default value of the argument. When an expression is passed to `label`, it is evaluated in the context of a `data.frame` containing the results of a call to `table_results` on the `x` argument, with an additional column labeled `name`, which contains the node names.

Another way to create custom labels is by requesting auxiliary variables using the `columns` argument (which is passed to `table_results`), and then using these columns to construct a new label. See examples.

Value

An object of class `'tidy_nodes'`

Examples

```
# Standard use extracts node names and shape
# (rect for observed, oval for latent)
library(lavaan)
res <- sem("dist ~ speed", cars)
get_nodes(res)

# To label nodes with mean values, include meanstructure in the model
# Note that it is possible to pass the argument 'digits' to table_results
# through '...'
res <- sem("dist ~ speed", cars, meanstructure = TRUE)
get_nodes(res, digits = 3)

# Pass an expression to the 'label' argument for custom labels
get_nodes(res, label = paste0(name, " ", est_sig, "\n", confint))

# Pass the argument 'columns' to table_results through '...' to retain
# auxiliary columns for further processing
nod <- get_nodes(res, columns = c("est_sig", "confint"))
nod
nod <- within(nod, {label <- paste0(name, " ", est_sig, "\n", confint)})
nod
```

graph_sem

Render a graph

Description

Render a graph based on a layout, and either nodes and edges, or a model object.

Usage

```
graph_sem(...)
```

```
## Default S3 method:
```

```

graph_sem(
  edges = NULL,
  layout = NULL,
  nodes = NULL,
  rect_width = 1.2,
  rect_height = 0.8,
  ellipses_width = 1,
  ellipses_height = 1,
  variance_diameter = 0.8,
  spacing_x = 2,
  spacing_y = 2,
  text_size = 4,
  curvature = 60,
  angle = NULL,
  fix_coord = FALSE,
  ...
)

## S3 method for class 'lavaan'
graph_sem(model, edges = NULL, layout = NULL, nodes = NULL, ...)

## S3 method for class 'MxModel'
graph_sem(model, edges = NULL, layout = NULL, nodes = NULL, ...)

## S3 method for class 'mplus.model'
graph_sem(model, edges = NULL, layout = NULL, nodes = NULL, ...)

## S3 method for class 'character'
graph_sem(...)

## S3 method for class 'mplusObject'
graph_sem(model, edges = NULL, layout = NULL, nodes = NULL, ...)

```

Arguments

| | |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ... | Additional arguments passed to and from functions. |
| edges | Object of class 'tidy_edges', or a data.frame with (at least) the columns c("from", "to"), and optionally, c("arrow", "label", "connect_from", "connect_to", "curvature"). |
| layout | A matrix (or data.frame) that describes the layout; see get_layout . |
| nodes | Optional, object of class 'tidy_nodes', created with the get_nodes function, or a data.frame with (at least) the column c("name"), and optionally, c("shape", "label"). If set to NULL (the default), nodes are inferred from the layout and edges arguments. |
| rect_width | Width of rectangles (used to display observed variables), Default: 1.2 |
| rect_height | Height of rectangles (used to display observed variables), Default: 0.8 |
| ellipses_width | Width of ellipses (used to display latent variables), Default: 1 |

| | |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ellipses_height | Height of ellipses (used to display latent variables), Default: 1 |
| variance_diameter | Diameter of variance circles, Default: .8 |
| spacing_x | Spacing between columns of the graph, Default: 1 |
| spacing_y | Spacing between rows of the graph, Default: 1 |
| text_size | Point size of text, Default: 4 |
| curvature | Curvature of curved edges. The curve is a circle segment originating in a point that forms a triangle with the two connected points, with angles at the two connected points equal to curvature. To flip a curved edge, use a negative value for curvature. Default: 60 |
| angle | Angle used to connect nodes by the top and bottom. Defaults to NULL, which means Euclidean distance is used to determine the shortest distance between node sides. A numeric value between 0-180 can be provided, where 0 means that only nodes with the same x-coordinates are connected top-to-bottom, and 180 means that all nodes are connected top-to-bottom. |
| fix_coord | Whether or not to fix the aspect ratio of the graph. Does not work with multi-group or multilevel models. Default: FALSE. |
| model | Instead of the edges argument, it is also possible to use the model argument and pass an object for which a method exists (e.g., <code>mplus.model</code> or <code>lavaan</code>). |

Details

The default interface simply Runs the functions `prepare_graph` and `plot`. The alternative interface first runs `get_nodes` and `get_edges` on the `model` argument.

Value

Object of class 'sem_graph'

Examples

```
library(lavaan)
res <- sem("dist ~ speed", cars)
graph_sem(res)
```

ic_weights

Compare Information Criteria

Description

IC weights quantify the evidence in favor of different models in a set. This function normalizes the IC values to obtain IC weights, which sum to 1. The model with the highest weight is most supported by the data. The ratio of different weights gives the relative support in favor of one model over another.

Usage

```
ic_weights(x, ...)
```

Arguments

```
x          An object for which a method exists.
...        Additional arguments.
```

Value

A list of class `ic_weights` with elements `$weights`, which contains the model weights, and `$comparison`, which contains the relative support in favor of each model over the others.

References

Wagenmakers, E. J., & Farrell, S. (2004). AIC model selection using Akaike weights. *Psychonomic bulletin & review*, 11(1), 192-196. doi:10.3758/BF03206482

Examples

```
ics <- c(100, 200, 102, 300)
ic_weights(ics)
```

```
if_edit
```

```
Conditionally edit a sem_graph object
```

Description

This function allows users to conditionally manipulate the edges and nodes of a `sem_graph` object. The generic function `if_edit` applies the expression `expr` to all rows of the nodes and edges data.frames for which `condition` is `TRUE`.

The wrapper functions documented in the Usage section have a hard-coded `expr` and `condition`; for example, `color_sig(color = "green")` colors all nodes and edges with `pval < .05` green. If no column exists for the assigned aesthetic (e.g., `color`), the wrappers assign the default argument (in this case, `color = "black"`) to all other nodes and edges.

Usage

```
if_edit(data, condition, expr, ...)

if_edges(data, condition, expr, ...)

if_nodes(data, condition, expr, ...)

## S3 method for class 'sem_graph'
if_edit(data, condition, expr, element = c("edges", "nodes"), ...)

Arguments

| | |
|--------------|--------------------------------------------------------------------------------------------|
| data | Object to manipulate. |
| condition | Expression that returns a logical vector when evaluated in the environment of data. |
| expr | Expression to perform on elements of data for which condition == TRUE. |
| ... | Additional arguments passed to and from functions. |
| element | Character vector. The elements of the sem_graph to edit, defaults to c("edges", "nodes"). |
| colour | Atomic character vector, indicating which colour to assign to the selected elements. |
| color | Atomic character vector, indicating which color to assign to the selected elements. |
| linetype | Atomic character vector, indicating which linetype to assign to the selected elements. |
| size | Atomic character vector, indicating which size to assign to the selected elements. |
| alpha | Atomic character vector, indicating which alpha to assign to the selected elements. |
| fill | Atomic character vector, indicating which fill to assign to the selected elements. |
| label_colour | Atomic character vector, indicating which label_colour to assign to the selected elements. |
| label_color | Atomic character vector, indicating which label_color to assign to the selected elements. |
| label_fill | Atomic character vector, indicating which label_fill to assign to the selected elements. |
| label_size | Atomic character vector, indicating which label_size to assign to the selected elements. |

| | |
|------------------|------------------------------------------------------------------------------------------------|
| label_alpha | Atomic character vector, indicating which label_alpha to assign to the selected elements. |
| label_family | Atomic character vector, indicating which label_family to assign to the selected elements. |
| label_fontface | Atomic character vector, indicating which label_fontface to assign to the selected elements. |
| label_hjust | Atomic character vector, indicating which label_hjust to assign to the selected elements. |
| label_vjust | Atomic character vector, indicating which label_vjust to assign to the selected elements. |
| label_lineheight | Atomic character vector, indicating which label_lineheight to assign to the selected elements. |
| label_location | Atomic character vector, indicating which label_location to assign to the selected elements. |

Value

Object of the same class as data.

Examples

```

```

`lr_lmr`*Lo-Mendell-Rubin Likelihood Ratio Test*

Description

Implements the ad-hoc adjusted likelihood ratio test (LRT) described in Formula 15 of Lo, Mendell, & Rubin (2001), or LMR LRT.

Usage

```
lr_lmr(x, ...)  
  
## S3 method for class 'list'  
lr_lmr(x, y, ...)
```

Arguments

| | |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>x</code> | An object for which a method exists. |
| <code>...</code> | Additional arguments. |
| <code>y</code> | A list with elements <code>c("-2LL", "parameters", "n", "classes")</code> . Note that, if this argument is used, <code>x</code> must also be a list with the same elements. |

Value

A numeric vector containing the likelihood ratio LR, the ad-hoc corrected LMR, degrees of freedom, and the LMR p-value.

References

Lo Y, Mendell NR, Rubin DB. Testing the number of components in a normal mixture. *Biometrika*. 2001;88(3):767-778. doi:10.1093/biomet/88.3.767

Examples

```
lr_lmr(  
  x = list("-2LL" = -741.02,  
           "parameters" = 8,  
           "n" = 150,  
           "classes" = 1),  
  y = list("-2LL" = -488.91,  
           "parameters" = 13,  
           "n" = 150,  
           "classes" = 2))
```

| | |
|---------|---------------------------------------|
| lr_test | <i>Conduct Likelihood Ratio tests</i> |
|---------|---------------------------------------|

Description

For a multigroup model of class `MxModel`, conduct overall and pairwise likelihood ratio tests. All submodels must be identical.

Usage

```
lr_test(x, compare = c("All", "A", "S", "F", "M", "Thresholds"), ...)
```

Arguments

| | |
|----------------------|-----------------------------------------------------------------------------------------------|
| <code>x</code> | An object for which a method exists. |
| <code>compare</code> | Character vector, indicating which matrices to constrain to be equal in pairwise comparisons. |
| <code>...</code> | Additional arguments passed to other functions. |

Value

An object of class `lr_test` and `list`.

Examples

```
df <- iris[c(1:10, 140:150), c(1, 5)]
names(df) <- c("x", "group")
mod <- as_ram("x~1", data = df, group = "group")
mod <- run_mx(mod)
lr_test(mod)
```

| | |
|------|------------------------------------------------|
| lsub | <i>Apply pattern replacement over a vector</i> |
|------|------------------------------------------------|

Description

`lsub` returns a list of the same length as `replacement`, each element of which is the result of applying `gsub` to `x` using `lapply`.

Usage

```
lsub(x, replacement = NULL, pattern = "{C}", fixed = TRUE, ...)
```

Arguments

| | |
|-------------|-------------------------------------------------------------------------------------------------------------|
| x | A character vector where matches are sought. |
| replacement | a character vector of length 1 or more. Each element is applied to x in turn. Default: NULL |
| pattern | A character string containing a regular expression (or character string when fixed = TRUE). Default: '{C}'. |
| fixed | logical. If TRUE, pattern is a string to be matched as is. Default: TRUE |
| ... | Parameters passed on to <code>gsub</code> . |

Value

A list of results returned by `gsub`.

Examples

```
lsub("a{C}", 1:3)
```

| | |
|----------------|---------------------------------------------------------|
| maene_identity | <i>National Identity, Discrimination and Depression</i> |
|----------------|---------------------------------------------------------|

Description

These synthetic data are based on a study by Maene and colleagues, which conducted an LCA with ordinal indicators on National, Regional, and Heritage Identities in Flemish (Belgian) high-school students with a migration background, and examined between class differences in perceived discrimination by teachers and depressive symptoms.

Usage

```
data(maene_identity)
```

Format

A data frame with 439 rows and 13 variables.

Details

| | | |
|--------------------|---------|------------------------------------------------------------------------------------------------------------|
| Ethnic_1 | ordered | when I introduce myself, I would definitely say I belong to this group, answered on a 5-point Likert scale |
| Ethnic_2 | ordered | I have a strong sense of belonging to this group, answered on a 5-point Likert scale |
| Ethnic_3 | ordered | I see myself as a member of this group, answered on a 5-point Likert scale |
| Belgian | ordered | Do you feel a member of the Belgian group, answered on a 10-point Likert scale |
| Flemish | ordered | Do you feel a member of the Flemish group, answered on a 10-point Likert scale |
| age | numeric | Participant age |
| sex | factor | Participant sex |
| ses | numeric | Socio-economic status, measured using the International Socio-Economic Index of Occupational SES |
| belgianborn | factor | Whether or not the participant was born in Belgium |

| | | |
|---------------------|---------|------------------------------------------------------------------------------------------------------------------|
| age_belgium | numeric | Age at which the participant migrated to Belgium |
| vict_bully | factor | Whether or not the participant has ever been the victim of peer bullying for any reason |
| vict_teacher | factor | Whether or not the participant has ever been insulted, threatened, pushed, treated unfairly or excluded |
| depression | numeric | Scale scores of self-reported depressive feelings, assessed using the a ten-item scale with 5-point Likert scale |

Perceived teacher discrimination and depressive feelings in adolescents: the role of national, regional, and heritage identities in Flemish schools. *Journal of youth and adolescence*, 51(12), 2281-2293. doi:10.1007/s10964022016657

measurement

Generate syntax for a measurement model

Description

Generate syntax for a measurement model for latent variables. This function relies on [add_paths](#) to generate syntax.

Usage

```
measurement(x, ...)
```

Arguments

x An object for which a method exists, including `tidy_sem` (generated using [dictionary](#), or `data.frame` (for which [dictionary](#) will be run first).

... Additional parameters passed to [add_paths](#).

Value

An object of class `tidy_sem`.

Examples

```
dict <- tidy_sem(c("bfi_1", "bfi_2", "bfi_3", "bfi_4", "bfi_5"))
measurement(dict)
```

| | |
|----------------|----------------------------------------------------------------------|
| mixture_starts | <i>Automatically set starting values for an OpenMx mixture model</i> |
|----------------|----------------------------------------------------------------------|

Description

Automatically set starting values for an OpenMx mixture model. This function was designed to work with mixture models created using tidySEM functions like `mx_mixture`, and may not work with other `mxModels`.

Usage

```
mixture_starts(model, splits, ...)
```

Arguments

| | |
|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| model | A mixture model of class <code>mxModel</code> . |
| splits | Optional. A numeric vector of length equal to the number of rows in the <code>mxData</code> used in the <code>model</code> object. The data will be split by this vector. See Details for the default setting and possible alternatives. |
| ... | Additional arguments, passed to functions. |

Details

Starting values are derived by the following procedure:

1. The mixture model is converted to a multi-group model.
2. The data are split along `splits`, and assigned to the corresponding groups of the multi-group model.
3. The multi-group model is run, and the final values of each group are assigned to the corresponding mixture component as starting values.
4. The mixture model is returned with these starting values.

If the argument `splits` is not provided, the function will call `kmeans(x = data, centers = classes)$cluster`, where `data` is extracted from the `model` argument.

Sensible ways to split the data include:

- Using Hierarchical clustering: `cutree(hclust(dist(data)), k = classes)`
- Using K-means clustering: `kmeans(x = data, centers = classes)$cluster`
- Using agglomerative hierarchical clustering: `hclass(hc(data = data), G = classes)[, 1]`
- Using a random split: `sample.int(n = classes, size = nrow(data), replace = TRUE)`

Value

Returns an `mxModel` with starting values.

References

Shireman, E., Steinley, D. & Brusco, M.J. Examining the effect of initialization strategies on the performance of Gaussian mixture modeling. *Behav Res* 49, 282–293 (2017). doi:10.3758/s13428-01506976

Examples

```
## Not run:
df <- iris[, 1, drop = FALSE]
names(df) <- "x"
mod <- mx_mixture(model = "x ~ m{C}*1
                        x ~~ v{C}*x",
                  classes = 2,
                  data = df,
                  run = FALSE)

mod <- mixture_starts(mod)

## End(Not run)
```

| | |
|--------------------|------------------------------------------------|
| mplus_expand_names | <i>Expand abbreviated Mplus variable names</i> |
|--------------------|------------------------------------------------|

Description

Expand the Mplus syntax for abbreviating lists of variable names.

Usage

```
mplus_expand_names(x)
```

Arguments

x Atomic character string containing the variable names section of an Mplus syntax file.

Value

Character vector of names.

Examples

```
mplus_expand_names("test1-test12")
mplus_expand_names("testa-testb")
```

 mx_dummies

Dummy Code Factor Variables

Description

For each variable v that inherits `factor`, create a number of new variables equal to `levels(v)` to indicate group membership (1) or non-membership (0) of that level. The resulting dummies have class `mxFactor`.

Usage

```
mx_dummies(x, classes = c("factor", "character"), ...)
```

Arguments

| | |
|----------------------|---------------------------------------------------------------------------------------------------------------|
| <code>x</code> | An object for which a method exists. |
| <code>classes</code> | Character vector, indicating which classes to dummy code. Defaults to <code>c("factor", "character")</code> . |
| <code>...</code> | Arguments |

Value

A `data.frame`.

Examples

```
mx_dummies(iris[1:5,])
```

 mx_growth_mixture

Estimate growth mixture models using OpenMx

Description

This function is a wrapper around `mx_mixture`, adding the default arguments of `growth` to simplify the specification of growth mixture models. This function is only useful if all the latent variables in the model are growth factors.

Usage

```
mx_growth_mixture(model, classes = 1L, data = NULL, run = TRUE, ...)
```

Arguments

| | |
|---------|-----------------------------------------------------------------------------------------------------------------------------------------|
| model | Syntax for the model; either a character string, or a list of character strings, or a list of mxModel objects. See Details. |
| classes | A vector of integers, indicating which class solutions to generate. Defaults to 1L. E.g., classes = 1:6, classes = c(1:4, 6:8). |
| data | The data.frame to be used for model fitting. |
| run | Logical, whether or not to run the model. If run = TRUE, the function calls mixture_starts and run_mx . |
| ... | Additional arguments, passed to functions. |

Value

Returns an [mxModel](#).

Examples

```
## Not run:
data("empathy")
df <- empathy[1:6]
mx_growth_mixture(model = "i =~ 1*ec1 + 1*ec2 + 1*ec3 +1*ec4 +1*ec5 +1*ec6
                        s =~ 0*ec1 + 1*ec2 + 2*ec3 +3*ec4 +4*ec5 +5*ec6
                        ec1 ~~ vec1*ec1
                        ec2 ~~ vec2*ec2
                        ec3 ~~ vec3*ec3
                        ec4 ~~ vec4*ec4
                        ec5 ~~ vec5*ec5
                        ec6 ~~ vec6*ec6
                        i ~~ 0*i
                        s ~~ 0*s
                        i ~~ 0*s",
                  classes = 2,
                  data = df) -> res

## End(Not run)
```

mx_lca

Estimate latent class analyses using OpenMx

Description

This function simplifies the specification of latent class models: models that estimate membership of a categorical latent variable based on binary or ordinal indicators.

Usage

```
mx_lca(data = NULL, classes = 1L, run = TRUE, ...)
```

Arguments

| | |
|---------|----------------------------------------------------------------------------------------------------------------|
| data | The data.frame to be used for model fitting. |
| classes | A vector of integers, indicating which class solutions to generate. Defaults to 1L. E.g., classes = 1:6, |
| run | Logical, whether or not to run the model. If run = TRUE, the function calls mxTryHardOrdinal . |
| ... | Additional arguments, passed to functions. |

Value

Returns an [mxModel](#).

Examples

```
## Not run:
df <- data_mix_ordinal
df[1:4] <- lapply(df, ordered)
mx_lca(data = df,
        classes = 2) -> res

## End(Not run)
```

 mx_mixture

Estimate mixture models using OpenMx

Description

Dynamically creates a batch of mixture models, with intelligent defaults. See Details for more information.

Usage

```
mx_mixture(model, classes = 1L, data = NULL, run = TRUE, ...)
```

Arguments

| | |
|---------|---------------------------------------------------------------------------------------------------------------------------------------------|
| model | Syntax for the model; either a character string, or a list of character strings, or a list of mxModel objects. See Details. |
| classes | A vector of integers, indicating which class solutions to generate. Defaults to 1L. E.g., classes = 1:6, classes = c(1:4, 6:8). |
| data | The data.frame to be used for model fitting. |
| run | Logical, whether or not to run the model. If run = TRUE, the function calls mixture_starts and run_mx . |
| ... | Additional arguments, passed to functions. |

Details

Model syntax can be specified in three ways, for ease of use and flexibility:

1. An atomic character string with lavaan syntax. Within this syntax, the character string {C} is dynamically substituted with the correct class number using `lsub`, for example to set unique parameter labels for each class, or to specify equality constraints. E.g., $x \sim m\{C\}*1$ will be expanded to $x \sim m1*1$ and $x \sim m2*1$ when `classes = 2`. The resulting syntax for each class will be converted to an `mxModel` using `as_ram`.
2. A list of character strings with lavaan syntax. Each item of the list will be converted to a class-specific `mxModel` using `as_ram`.
3. A list of `mxModel` objects, specified by the user.

Value

Returns an `mxModel`.

Examples

```
## Not run:
# Example 1: Dynamic model generation using {C}
df <- iris[, 1, drop = FALSE]
names(df) <- "x"
mx_mixture(model = "x ~ m{C}*1
                 x ~~ v{C}*x", classes = 1, data = df)
# Example 2: Manually specified class-specific models
df <- iris[1:2]
names(df) <- c("x", "y")
mx_mixture(model = list("y ~ a*x",
                       "y ~ b*x"),
           meanstructure = TRUE,
           data = df) -> res

# Example 3: Latent growth model
df <- empathy[1:6]
mx_mixture(model = "i =~ 1*ec1 + 1*ec2 + 1*ec3 + 1*ec4 + 1*ec5 + 1*ec6
                  s =~ 0*ec1 + 1*ec2 + 2*ec3 + 3*ec4 + 4*ec5 + 5*ec6",
           classes = 2,
           data = df) -> res

## End(Not run)
```

Description

This function is a wrapper around `mx_mixture` to simplify the specification of latent profile models, also known as finite mixture models. By default, the function estimates free means for all observed variables across classes.

Usage

```
mx_profiles(
  data = NULL,
  classes = 1L,
  variances = "equal",
  covariances = "zero",
  run = TRUE,
  expand_grid = FALSE,
  ...
)
```

Arguments

| | |
|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>data</code> | The data.frame to be used for model fitting. |
| <code>classes</code> | A vector of integers, indicating which class solutions to generate. Defaults to 1L. E.g., <code>classes = 1:6</code> , |
| <code>variances</code> | Character vector. Specifies which variance components to estimate. Defaults to "equal" (constrain variances across classes); the other option is "varying" (estimate variances freely across classes). Each element of this vector refers to one of the models you wish to run. |
| <code>covariances</code> | Character vector. Specifies which covariance components to estimate. Defaults to "zero" (covariances constrained to zero; this corresponds to an assumption of conditional independence of the indicators); other options are "equal" (covariances between items constrained to be equal across classes), and "varying" (free covariances across classes). |
| <code>run</code> | Logical, whether or not to run the model. If <code>run = TRUE</code> , the function calls mixture_starts and run_mx . |
| <code>expand_grid</code> | Logical, whether or not to estimate all possible combinations of the variances and covariances arguments. Defaults to FALSE. |
| <code>...</code> | Additional arguments, passed to functions. |

Value

Returns an [mxModel](#).

Examples

```
## Not run:
data("empathy")
df <- empathy[1:6]
mx_profiles(data = df,
            classes = 2) -> res

## End(Not run)
```

| | |
|------------------|--------------------------------|
| mx_switch_labels | <i>Switch LCA Class Labels</i> |
|------------------|--------------------------------|

Description

The order of class labels in LCA is arbitrary. This can result in a phenomenon called 'label switching', where classes change places between replications of an analysis. This function attempts to re-order classes in a substantively meaningful way.

Usage

```
mx_switch_labels(x, param = "weights", decreasing = TRUE, order = NULL)
```

Arguments

| | |
|------------|----------------------------------------------------------------------------------------------------------------------|
| x | An MxModel estimated by mx_mixture or one of its wrappers. |
| param | The parameter by which to order the classes, defaults to 'weights', which orders classes based on their sample size. |
| decreasing | logical. Should the classes be sorted in increasing or decreasing order? Default: TRUE |
| order | Integer, indicating the ordering of classes. Ignored when NULL (default). |

Details

The argument param can accept either:

1. The default string "weights", in which classes are sorted by size.
2. The OpenMx matrix indicator for a specific model parameter; e.g., the first mean is indicated by "M[1,1]". These indicators can be viewed by running `table_results(x, columns = NULL)`.
3. The letter indicating an OpenMx model matrix, e.g., "M" refers to the matrix of means. To account for all elements of the matrix, Euclidean distance to the origin is used.

Value

An MxModel with "tidySEM" attribute: "mixture"

Examples

```
## Not run:
df <- iris[1:4]
names(df) <- letters[1:4]
res1 <- mx_profiles(data = df, classes = 2)
mx_switch_labels(res1, decreasing = FALSE)

## End(Not run)
```

| | |
|-------|-------------------------------------|
| nodes | <i>Extract nodes from sem_graph</i> |
|-------|-------------------------------------|

Description

Provides access to the nodes element of a sem_graph object. This can be used to return or assign to the nodes element.

Usage

```
nodes(x)
```

```
nodes(x) <- value
```

Arguments

| | |
|-------|-----------------------------|
| x | Object of class sem_graph. |
| value | A valid value for nodes(x). |

Value

data.frame

Examples

```
edg <- data.frame(from = "x", to = "y")
p <- prepare_graph(edges = edg, layout = get_layout("x", "y", rows = 1))
nodes(p)
```

| | |
|--------|----------------------------------------------|
| paste2 | <i>Concatenate Strings while omitting NA</i> |
|--------|----------------------------------------------|

Description

Concatenate vectors after converting to character and removing NA values. See [paste](#).

Usage

```
paste2(..., sep = " ", collapse = NULL, na.rm = TRUE)
```

Arguments

| | |
|----------|---------------------------------------------------------------------------------------------------|
| ... | one or more R objects, to be converted to character vectors. |
| sep | a character string to separate the terms. Not NA_character_. |
| collapse | an optional character string to separate the results. Not NA_character_. |
| na.rm | logical, indicating whether NA values should be stripped before concatenation. Not NA_character_. |

Value

A character vector of the concatenated values.

Examples

```
paste2("word", NA)
```

| | |
|-----------------|----------------------------------|
| plas_depression | <i>Simulated depression data</i> |
|-----------------|----------------------------------|

Description

This simulated dataset, based on work in progress by Plas and colleagues, contains six repeated measurements of the Depression subscale of the Symptom Checklist-90 (SCL-90).

Usage

```
data(plas_depression)
```

Format

A data frame with 978 rows and 6 variables.

Details

These data are inspired by the *Prospection in Stress-related Military Research (PRISMO)* study, which examined of psychological problems after deployment in more than 1,000 Dutch military personnel who were deployed to Afghanistan, from 2005-2019.

| | | |
|--------------|---------|--------------------------------------------------------|
| scl.1 | integer | Sum score of SCL90 depression pre-deployment |
| scl.2 | integer | Sum score of SCL90 depression 1 month post-deployment |
| scl.3 | integer | Sum score of SCL90 depression 6 months post-deployment |
| scl.4 | integer | Sum score of SCL90 depression 1 year post-deployment |
| scl.5 | integer | Sum score of SCL90 depression 2 years post-deployment |
| scl.6 | integer | Sum score of SCL90 depression 10 years post-deployment |

| | |
|----------------|-----------------------------------------------------|
| plot_bivariate | <i>Create correlation plots for a mixture model</i> |
|----------------|-----------------------------------------------------|

Description

Creates a faceted plot of two-dimensional correlation plots and unidimensional density plots for a single mixture model.

Usage

```
plot_bivariate(
  x,
  variables = NULL,
  sd = TRUE,
  cors = TRUE,
  rawdata = TRUE,
  bw = FALSE,
  alpha_range = c(0, 0.1),
  return_list = FALSE
)
```

Arguments

| | |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| x | An object for which a method exists. |
| variables | Which variables to plot. If NULL, plots all variables that are present in the model. |
| sd | Logical. Whether to show the estimated standard deviations as lines emanating from the cluster centroid. |
| cors | Logical. Whether to show the estimated correlation (standardized covariance) as ellipses surrounding the cluster centroid. |
| rawdata | Logical. Whether to plot raw data, weighted by posterior class probability. |
| bw | Logical. Whether to make a black and white plot (for print) or a color plot. Defaults to FALSE, because these density plots are hard to read in black and white. |
| alpha_range | Numeric vector (0-1). Sets the transparency of geom_density and geom_point. |
| return_list | Logical. Whether to return a list of ggplot objects, or just the final plot. Defaults to FALSE. |

Value

An object of class 'ggplot'.

Author(s)

Caspar J. van Lissa

Examples

```
iris_sample <- iris[c(1:5, 145:150), c("Sepal.Length", "Sepal.Width")]
names(iris_sample) <- c("x", "y")
res <- mx_profiles(iris_sample, classes = 2)
plot_bivariate(res, rawdata = FALSE)
```

| | |
|--------------|------------------------------------------------|
| plot_density | <i>Create density plots for mixture models</i> |
|--------------|------------------------------------------------|

Description

Creates mixture density plots. For each variable, a Total density plot will be shown, along with separate density plots for each latent class, where cases are weighted by the posterior probability of being assigned to that class.

Usage

```
plot_density(  
  x,  
  variables = NULL,  
  bw = FALSE,  
  conditional = FALSE,  
  alpha = 0.2,  
  facet_labels = NULL  
)
```

Arguments

| | |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| x | Object for which a method exists. |
| variables | Which variables to plot. If NULL, plots all variables that are present in all models. |
| bw | Logical. Whether to make a black and white plot (for print) or a color plot. Defaults to FALSE, because these density plots are hard to read in black and white. |
| conditional | Logical. Whether to show a conditional density plot (surface area is divided among the latent classes), or a classic density plot (surface area of the total density plot is equal to one, and is divided among the classes). |
| alpha | Numeric (0-1). Only used when bw and conditional are FALSE. Sets the transparency of geom_density, so that classes with a small number of cases remain visible. |
| facet_labels | Named character vector, the names of which should correspond to the facet labels one wishes to rename, and the values of which provide new names for these facets. For example, to rename variables, in the example with the 'iris' data below, one could specify: facet_labels = c("Pet_leng" = "Petal length"). |

Value

An object of class 'ggplot'.

Author(s)

Caspar J. van Lissa

Examples

```
## Not run:
dat <-
  iris[, c("Sepal.Length", "Sepal.Width", "Petal.Length", "Petal.Width")]
names(dat) <- paste0("x", 1:4)
res <- mx_profiles(dat, 1:3)
plot_density(res)

## End(Not run)
```

plot_prob

Plot categorical variable probabilities

Description

Creates a bar chart of categorical variable probabilities with bars reflecting the probability of category membership for each category of the observed variable.

Usage

```
plot_prob(
  x,
  variables = NULL,
  bars = c("Variable", "group", "class"),
  facet = c("group", "class", "Variable"),
  bw = FALSE,
  ...
)
```

Arguments

| | |
|-----------|------------------------------------------------------------------------------------------------------|
| x | An object for which a method exists |
| variables | A character vectors with the names of the variables to be plotted (optional). |
| bars | Atomic character, indicating what separate bars represent. One of c("Variable", "group", "class"). |
| facet | Atomic character, indicating what separate facets represent. One of c("group", "class", "Variable"). |
| bw | Logical. Should the plot be black and white (for print), or color? |
| ... | Arguments passed to and from other functions. |

Value

An object of class 'ggplot'.

Author(s)

Caspar J. van Lissa

Examples

```
df_plot <- data.frame(Variable = rep(c("u1", "u2"), each = 3),
  Category = rep(1:3, 2),
  Probability = c(0.3381302605812, 0.148395173612088, 0.513474565806711,
  0.472337708760608, 0.118484201496432, 0.40917808974296))
plot_prob(df_plot)
```

plot_profiles

Create latent profile plots

Description

Creates a profile plot (ribbon plot) according to best practices, focusing on the visualization of classification uncertainty by showing:

1. Bars reflecting a confidence interval for the class centroids
2. Boxes reflecting the standard deviations within each class; a box encompasses +/- 64 percent of the observations in a normal distribution
3. Raw data, whose transparency is weighted by the posterior class probability, such that each observation is most clearly visible for the class it is most likely to be a member of.

Usage

```
plot_profiles(
  x,
  variables = NULL,
  ci = 0.95,
  sd = TRUE,
  add_line = FALSE,
  rawdata = TRUE,
  bw = FALSE,
  alpha_range = c(0, 0.1),
  ...
)
```

```
## Default S3 method:
```

```
plot_profiles(
  x,
  variables = NULL,
  ci = 0.95,
  sd = TRUE,
  add_line = FALSE,
  rawdata = TRUE,
  bw = FALSE,
  alpha_range = c(0, 0.1),
  ...
)
```

Arguments

| | |
|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| x | An object containing the results of a mixture model analysis. |
| variables | A character vectors with the names of the variables to be plotted (optional). |
| ci | Numeric. What confidence interval should the error bars span? Defaults to a 95 percent confidence interval. Set to NULL to remove error bars. |
| sd | Logical. Whether to display a box encompassing +/- 1SD Defaults to TRUE. |
| add_line | Logical. Whether to display a line, connecting cluster centroids belonging to the same latent class. Defaults to FALSE, as it is not recommended to imply connectivity between the different variables on the X-axis. |
| rawdata | Should raw data be plotted in the background? Setting this to TRUE might result in long plotting times. |
| bw | Logical. Should the plot be black and white (for print), or color? |
| alpha_range | The minimum and maximum values of alpha (transparency) for the raw data. Minimum should be 0; lower maximum values of alpha can help reduce overplotting. |
| ... | Arguments passed to and from other functions. |

Value

An object of class 'ggplot'.

Author(s)

Caspar J. van Lissa

Examples

```
df_plot <- data.frame(Variable = "x1",
  Class = "class1",
  Classes = 1,
  Model = "equal var 1",
  Value = 3.48571428571429,
  se = 0.426092805342181,
  Value.Variances = 3.81265306156537,
  se.Variances = 1.17660769119959)
plot_profiles(list(df_plot = df_plot, df_raw = NULL),
  ci = NULL, sd = FALSE, add_line = FALSE,
  rawdata = FALSE, bw = FALSE)
```

| | |
|---------------|---------------------------|
| prepare_graph | <i>Prepare graph data</i> |
|---------------|---------------------------|

Description

Prepare an object of class `sem_graph`, containing data objects that can be rendered into a SEM graph. Using this function allows users to manually change the default graph specification before plotting it. Input consists of (at least) a layout, and either nodes and edges, or a model object.

Usage

```
prepare_graph(...)  
  
## Default S3 method:  
prepare_graph(  
  edges = NULL,  
  layout = NULL,  
  nodes = NULL,  
  rect_width = 1.2,  
  rect_height = 0.8,  
  ellipses_width = 1,  
  ellipses_height = 1,  
  variance_diameter = 0.8,  
  spacing_x = 2,  
  spacing_y = 2,  
  text_size = 4,  
  curvature = 60,  
  angle = NULL,  
  fix_coord = FALSE,  
  ...  
)  
  
## S3 method for class 'lavaan'  
prepare_graph(  
  model,  
  edges = get_edges(x = model),  
  layout = get_layout(x = model),  
  nodes = get_nodes(x = model),  
  ...  
)  
  
## S3 method for class 'MxModel'  
prepare_graph(  
  model,  
  edges = get_edges(x = model),  
  layout = get_layout(x = model),  
  nodes = get_nodes(x = model),
```

```

    ...
  )

  ## S3 method for class 'character'
  prepare_graph(...)

  ## S3 method for class 'mplus.model'
  prepare_graph(
    model,
    edges = get_edges(x = model),
    layout = get_layout(x = model),
    nodes = get_nodes(x = model),
    ...
  )

  ## S3 method for class 'mplusObject'
  prepare_graph(
    model,
    edges = get_edges(x = model),
    layout = get_layout(x = model),
    nodes = get_nodes(x = model),
    ...
  )

```

Arguments

| | |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ... | Additional arguments passed to and from functions. |
| edges | Object of class 'tidy_edges', or a data.frame with (at least) the columns c("from", "to"), and optionally, c("arrow", "label", "connect_from", "connect_to", "curvature"). |
| layout | A matrix (or data.frame) that describes the layout; see get_layout . |
| nodes | Optional, object of class 'tidy_nodes', created with the get_nodes function, or a data.frame with (at least) the column c("name"), and optionally, c("shape", "label"). If set to NULL (the default), nodes are inferred from the layout and edges arguments. |
| rect_width | Width of rectangles (used to display observed variables), Default: 1.2 |
| rect_height | Height of rectangles (used to display observed variables), Default: 0.8 |
| ellipses_width | Width of ellipses (used to display latent variables), Default: 1 |
| ellipses_height | Height of ellipses (used to display latent variables), Default: 1 |
| variance_diameter | Diameter of variance circles, Default: .8 |
| spacing_x | Spacing between columns of the graph, Default: 1 |
| spacing_y | Spacing between rows of the graph, Default: 1 |
| text_size | Point size of text, Default: 4 |

| | |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| curvature | Curvature of curved edges. The curve is a circle segment originating in a point that forms a triangle with the two connected points, with angles at the two connected points equal to curvature. To flip a curved edge, use a negative value for curvature. Default: 60 |
| angle | Angle used to connect nodes by the top and bottom. Defaults to NULL, which means Euclidean distance is used to determine the shortest distance between node sides. A numeric value between 0-180 can be provided, where 0 means that only nodes with the same x-coordinates are connected top-to-bottom, and 180 means that all nodes are connected top-to-bottom. |
| fix_coord | Whether or not to fix the aspect ratio of the graph. Does not work with multi-group or multilevel models. Default: FALSE. |
| model | Instead of the edges argument, it is also possible to use the model argument and pass an object for which a method exists (e.g., <code>mplus.model</code> or <code>lavaan</code>). |

Value

Object of class 'sem_graph'

Examples

```
library(lavaan)
res <- sem("dist ~ speed", cars)
prepare_graph(res)
```

run_lavaan

Run as lavaan model

Description

This convenience function runs objects for which a method exists using lavaan. It is intended for use with tidySEM, and passes the `$syntax` and `$data` elements of a `tidy_sem` object on to [lavaan](#).

Usage

```
run_lavaan(x, ...)
```

Arguments

`x` An object for which a method exists.
`...` Parameters passed on to other functions.

Value

Returns a lavaan object.

Examples

```
df <- iris[1:3]
names(df) <- paste0("X_", 1:3)
run_lavaan(measurement(tidy_sem(df), meanstructure = TRUE))
```

run_mx

Run as OpenMx model with sensible defaults

Description

This convenience function runs objects for which a method exists using OpenMx, with sensible defaults. It is intended for use with tidySEM. For instance, it will convert a tidySEM object to a mxModel and run it, and it will try to ensure convergence for mixture models created using [mx_mixture](#). Knowledgeable users may want to run models manually.

Usage

```
run_mx(x, ...)
```

Arguments

x An object for which a method exists.
 ... Parameters passed on to other functions.

Value

Returns an [mxModel](#) with free parameters updated to their final values.

Examples

```
df <- iris[1:3]
names(df) <- paste0("X_", 1:3)
run_mx(measurement(tidy_sem(df), meanstructure = TRUE))
```

skew_kurtosis

Calculate skew and kurtosis

Description

Calculate skew and kurtosis, standard errors for both, and the estimates divided by two times the standard error. If this latter quantity exceeds an absolute value of 1, the skew/kurtosis is significant. With very large sample sizes, significant skew/kurtosis is common.

Usage

```
skew_kurtosis(x, verbose = FALSE, se = FALSE, ...)
```

Arguments

| | |
|----------------------|--------------------------------------------------------------------------|
| <code>x</code> | An object for which a method exists. |
| <code>verbose</code> | Logical. Whether or not to print messages to the console, Default: FALSE |
| <code>se</code> | Whether or not to return the standard errors, Default: FALSE |
| <code>...</code> | Additional arguments to pass to and from functions. |

Value

A matrix of skew and kurtosis statistics for `x`.

Examples

```
skew_kurtosis(datasets::anscombe)
```

| | |
|---------------------|-------------------------------------|
| <code>syntax</code> | <i>Extract syntax from tidy_sem</i> |
|---------------------|-------------------------------------|

Description

Provides access to the `syntax` element of a `tidy_sem` object. This can be used to return or assign to the `syntax` element.

Usage

```
syntax(x)

syntax(x) <- value
```

Arguments

| | |
|--------------------|--------------------------------------------|
| <code>x</code> | Object of class <code>tidy_sem</code> . |
| <code>value</code> | A valid value for <code>syntax(x)</code> . |

Value

`data.frame`

Examples

```
dict <- tidy_sem(iris, split = "\\.")
dict <- add_paths(dict, Sepal.Width ~ Sepal.Length)
syntax(dict)
```

| | |
|------------|-----------------------------------|
| table_cors | <i>Extract correlation tables</i> |
|------------|-----------------------------------|

Description

Extracts a publication-ready covariance or correlation matrix from an object for which a method exists.

Usage

```
table_cors(x, value_column = "est_sig_std", digits = 2, ...)
```

Arguments

| | |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| x | An object for which a method exists. |
| value_column | Character. Name of the column to use to propagate the matrix. Defaults to "est_sig_std", the standardized estimate with significance asterisks. |
| digits | Number of digits to round to when formatting values. |
| ... | Additional arguments passed to and from methods. |

Value

A Matrix or a list of matrices (in case there are between/within correlation matrices).

Author(s)

Caspar J. van Lissa

Examples

```
library(lavaan)
HS.model <- ' visual =~ x1 + x2 + x3
            textual =~ x4 + x5 + x6
            speed   =~ x7 + x8 + x9 '
fit <- cfa(HS.model,
          data = HolzingerSwineford1939,
          group = "school")
table_cors(fit)
```

| | |
|-----------|--------------------------------------------------------|
| table_fit | <i>Print model fit table formatted for publication</i> |
|-----------|--------------------------------------------------------|

Description

Takes a model object, extracts model fit information, and formats it as a publication-ready table.

Usage

```
table_fit(x, ...)
```

Arguments

`x` A model object for which a method exists.
`...` Arguments passed to other functions.

Value

A data.frame of formatted results.

Author(s)

Caspar J. van Lissa

Examples

```
library(lavaan)
HS.model <- ' visual =~ x1 + x2 + x3
             textual =~ x4 + x5 + x6
             speed  =~ x7 + x8 + x9 '
fit <- cfa(HS.model,
           data = HolzingerSwineford1939,
           group = "school")
table_fit(fit)
```

| | |
|------------|-------------------------------------------|
| table_prob | <i>Results table in probability scale</i> |
|------------|-------------------------------------------|

Description

Returns thresholds for ordinal dependent variables in probability scale.

Usage

```
table_prob(x, ...)
```

Arguments

`x` An object for which a method exists.
`...` Arguments passed to other functions.

Value

A data.frame with results in probability scale.

See Also

Other Reporting tools: [conf_int\(\)](#), [est_sig\(\)](#), [table_fit\(\)](#), [table_results\(\)](#)

Examples

```
## Not run:
df <- data_mix_ordinal
df[1:4] <- lapply(df, ordered)
mx_lca(data = df,
         classes = 2) -> res

## End(Not run)
```

| | |
|---------------|------------------------------------------------------|
| table_results | <i>Print results table formatted for publication</i> |
|---------------|------------------------------------------------------|

Description

Takes a model object, and formats it as a publication-ready table.

Usage

```
table_results(
  x,
  columns = c("label", "est_sig", "se", "pval", "confint", "group", "level"),
  digits = 2,
  format_numeric = TRUE,
  ...
)
```

Arguments

| | |
|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>x</code> | A model object for which a method exists. |
| <code>columns</code> | A character vector of columns to retain from the results section. If this is set to NULL, all available columns are returned. Defaults to <code>c("label", "est_sig", "se", "pval", "confint", "group", "level")</code> . These correspond to 1) the parameter label, 2) estimate column with significance asterisks appended (* <.05, ** <.01, *** <.001); 3) standard error, 4) p-value, 5) a formatted confidence interval, 6) grouping variable (if available), 7) level variable for multilevel models, if available. |
| <code>digits</code> | Number of digits to round to when formatting numeric columns. |
| <code>format_numeric</code> | Logical, indicating whether or not to format numeric columns. Defaults to TRUE. |
| <code>...</code> | Logical expressions used to filter the rows of results returned. |

Value

A data.frame of formatted results.

Author(s)

Caspar J. van Lissa

Other Reporting tools: [conf_int\(\)](#), [est_sig\(\)](#), [table_fit\(\)](#), [table_prob\(\)](#)

Examples

```
library(lavaan)
HS.model <- ' visual =~ x1 + x2 + x3
            textual =~ x4 + x5 + x6
            speed   =~ x7 + x8 + x9 '
fit <- cfa(HS.model,
          data = HolzingerSwineford1939,
          group = "school")
table_results(fit)
```

`tidy_sem`*Create a tidy_sem object*

Description

Create an object of class `tidy_sem`, which has the following elements:

- `dictionary` An overview of the variables in the `tidy_sem` object, and their assignment to scale/latent variables.
- `data` Optionally, the `data.frame` containing the data referenced in `$dictionary`.
- `syntax` Optionally, syntax defining a SEM-model by reference to the variables contained in `$data`.

Usage

```
tidy_sem(x, split = "_")
```

Arguments

- | | |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>x</code> | An object for which a method exists, e.g., a vector of variable names, or a <code>data.frame</code> . |
| <code>split</code> | Character. Defining the regular expression used by <code>strsplit</code> to separate variable names into 1) the name of the scale/construct and 2) the number (or name) of the item. |

Details

When `tidy_sem` is called on a character string or `data.frame`, it attempts to assign variables to superordinate scale/latent variables based on the variable name and the splitting character defined in the `split` argument. Thus, the function will assign the variable `"scale_01"` to a scale/latent variable called `"scale"` when `split = "_"`. Alternatively, if the variable name is `"construct.1"`, the split character `"\."` separates the `"construct"` name from item number `"1"`. The character `"."` is escaped with a double backslash, because it is a special character in regular expressions.

Value

An object of class `"tidy_sem"`

Author(s)

Caspar J. van Lissa

Examples

```

tidy_sem(c("bfi_1", "bfi_2", "bfi_3", "bfi_4", "bfi_5",
"macqj_1", "macqj_2", "macqj_3", "macqj_4", "macqj_5", "macqj_6",

```

wald_test

Wald Test for Linear Hypotheses

Description

This function is a wrapper for the function `car::linearHypothesis()`, but which uses the `bain::bain()` syntax to parse equality constrained hypotheses.

Usage

```
wald_test(x, hypothesis, ...)
```

Arguments

| | |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------|
| <code>x</code> | An object for which a method exists. |
| <code>hypothesis</code> | A character string with equality constrained hypotheses, specified according to the <code>bain::bain()</code> syntax. |
| <code>...</code> | Additional arguments passed to <code>car::linearHypothesis()</code> . |

Value

A data.frame of class `wald_test`.

See Also

[linearHypothesis](#)

Examples

```
mod <- lm(Sepal.Length ~ Sepal.Width, data = iris)
coef(mod)
wald_test(mod, "Sepal.Width = 0")
```

zegwaard_carecompass *Caregiver Compass Data*

Description

These simulated data are based on a study by Dijenborgh, Swildens, and Zegwaard on different types of caregivers among those providing informal care to outpatients receiving mental healthcare.

Usage

```
data(zegwaard_carecompass)
```

Format

A data frame with 513 rows and 10 variables.

Details

| | | |
|---------------------|---------|------------------------------------------------------------------------------------------------------------------------------------|
| burdened | numeric | How strongly is the caregiver's life affected by their responsibilities? Scale score, based on 15 items |
| trapped | numeric | Caregiver's cognitions regarding freedom of choice. Scale score, based on 3 items with Likert-type response options |
| neg affect | numeric | Different types of negative emotions experienced by the caregiver. Scale score, based on 9 items with Likert-type response options |
| loneliness | numeric | Caregiver's perceived loneliness. Scale score, based on 11 items with Likert-type response options |
| sex | factor | Caregiver sex |
| sex patient | factor | Sex of the patient |
| cohabiting | factor | Whether or not the caregiver cohabits with the patient |
| distance | numeric | Travel time in minutes for the caregiver to reach the patient |
| freq visit | ordered | Ordinal variable, indicating frequency of visits |
| relationship | factor | Type of relationship of patient with caregiver |
